INTRODUCTION

This issue of *Aeronautical Engineering -- A Continuing Bibliography* (NASA SP-7037) lists 422 reports, journal articles and other documents originally announced in October 1988 in *Scientific and Technical Aerospace Reports (STAR)* or in *International Aerospace Abstracts (IAA)*.

The coverage includes documents on the engineering and theoretical aspects of design, construction, evaluation, testing, operation, and performance of aircraft (including aircraft engines) and associated components, equipment, and systems. It also includes research and development in aerodynamics, aeronautics, and ground support equipment for aeronautical vehicles.

Each entry in the bibliography consists of a standard bibliographic citation accompanied in most cases by an abstract. The listing of the entries is arranged by the first nine *STAR* specific categories and the remaining *STAR* major categories. This arrangement offers the user the most advantageous breakdown for individual objectives. The citations include the original accession numbers from the respective announcement journals. The *IAA* items will precede the *STAR* items within each category.

Seven indexes -- subject, personal author, corporate source, foreign technology, contract number, report number, and accession number -- are included.

An annual cumulative index will be published.

Information on the availability of cited publications including addresses of organizations and NTIS price schedules is located at the back of this bibliography.

TABLE OF CONTENTS

	Page
Category 01 Aeronautics (General)	629
Category 02 Aerodynamics Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.	630
Category 03 Air Transportation and Safety Includes passenger and cargo air transport operations; and aircraft accidents.	651
Category 04 Aircraft Communications and Navigation Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.	653
Category 05 Aircraft Design, Testing and Performance Includes aircraft simulation technology.	655
Category 06 Aircraft Instrumentation Includes cockpit and cabin display devices; and flight instruments.	662
Category 07 Aircraft Propulsion and Power Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and onboard auxiliary power plants for aircraft.	663
Category 08 Aircraft Stability and Control Includes aircraft handling qualities; piloting; flight controls; and autopilots.	667
Category 09 Research and Support Facilities (Air) Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tubes; and aircraft engine test stands.	671
Category 10 Astronautics Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; space communications, spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.	N.A.
Category 11 Chemistry and Materials Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; propellants and fuels; and materials processing.	673

Category 12	Engineering	675
	Includes engineering (general); communications and radar; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.	
Category 13	Geosciences	685
	Includes geosciences (general); earth resources and remote sensing; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.	
Category 14	Life Sciences	N.A.
	Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and space biology.	
Category 15	Mathematical and Computer Sciences	685
	Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.	
Category 16	Physics	687
	Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.	
Category 17	Social Sciences	689
	Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law, political science, and space policy; and urban technology and transportation.	
Category 18	Space Sciences	N.A.
	Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.	
Category 19	General	689

The Highly Manueverable Aircraft Technology (HiMAT) program consisted of design, fabrication of two subscale remotely piloted research vehicles (RPRVs), and flight test. This technical memorandum describes the vehicles and test approach. An overview of the flight test results and comparisons with the design predictions are presented. These comparisons are made on a single-discipline basis, so that aerodynamics, structures, flight controls, and propulsion controls are examined one by one. The interactions between the disciplines are then examined, with the conclusions that the integration of the various technologies contributed to total vehicle performance gains. An assessment is made of the subscale RPRV approach from the standpoint of research data quality and quantity, unmanned effects as compared with manned vehicles, complexity, and cost. It is concluded that the RPRV technique, as adopted in this program, resulted in a more complex and costly vehicle than expected but is reasonable when compared with alternate ways of obtaining comparable results.

ACCESSION NUMBER → **A88-10095#**

TITLE → **SYNTHESES OF REDUCED-ORDER CONTROLLERS FOR ACTIVE FLUTTER SUPPRESSION**

AUTHORS → **ATSUSHI FUJIMORI and HIROBUMI OHTA** Japan Society for Aeronautical and Space Sciences, Journal (ISSN 0021-4663), vol. 35, no. 402, 1987, p. 353-362. In Japanese, with abstract in English. refs ← JOURNAL TITLE

Reduced-order controllers for active flutter suppression of a two-dimensional airfoil are studied using two design approaches. One is based on the generalized Hessenberg representation (GHR) in the time domain, and the other, called the Nyquist frequency approximation (NFA), is a method in the frequency domain. In the NFA method, the reduced-order controllers are designed so that the stability margin of the Nyquist plot may be increased over a specific frequency range. To illustrate and to make a comparison between the two methods, numerical simulations are carried out using a thirteenth-order controlled plant. It is to be noted that the GHR method can yield quasi-optimal controllers in the sense of minimizing quadratic performance indices. The designed controllers, however, do not have enough stability margin, and the order reduction resulting from full state controllers may not be satisfactory. On the other hand, reduced-order controllers in the NFA method can be designed with increased stability margin at the expense of the performance index. For all simulation cases, the NFA method yields second-order controllers with a better stability margin than those by the GHR method. Thus, the NFA method provides an effective method for synthesizing robust reduced-order controllers.

AERONAUTICS (GENERAL)

A88-46051 Yale Univ., New Haven, Conn.
**THE DAEDALUS PROJECT - PHYSIOLOGICAL PROBLEMS
AND SOLUTIONS**

ETHAN R. NADEL (Yale University, New Haven, CT) and STEVEN R. BUSSOLARI (MIT, Cambridge, MA) *American Scientist* (ISSN 0003-0996), vol. 76, July-Aug. 1988, p. 350-360. Research supported by United Technologies Corp., Shaklee Corp., Smithsonian Institution, MIT, and NASA. refs

The physiological research for the Daedalus project which led to a man-powered flight of 119 km for about 4 hrs from Crete to the Greek island of Santorini in April 1988 is discussed. The ways in which candidate pilots were screened for aerobic power and ability to maintain oxygen delivery and the development of an energy-electrolyte drink for the flight are presented. The problems of heat dissipation, hydration, and maintaining fuel delivery are examined and endurance tests, including heart rate, change in plasma volume, oxygen uptake, plasma sodium and glucose levels, and mechanical power output are given in tables. From simulations, it was estimated that the pilot would lose on the order of 900 ml of water per hour during the flight. During the flight, the pilots heart rate did not exceed 142 beats per minute, confirming assessments made during simulation. R.B.

A88-46202
**HIGH G AND HIGH G PROTECTION - THE OPERATIONAL
SCENARIO**

A. D. MOIR and J. WALMSLEY (RAF, London, England) IN: High G and high G protection - Aeromedical and operational aspects; Proceedings of the Symposium, London, England, Oct. 21, 1987. London, Royal Aeronautical Society, 1987, p. 1-8.

An account is given of the ways in which the RAF conducts its fighter aircraft pilot training to acclimatize crewmembers to the accelerations of various phases of air combat. The perceptual, physical, and psychological stresses exerted by high-Gs in combat are discussed in the context of such tasks as visual identification of target aircraft, weapon-limited engagement maneuvers, multiple engagement scenarios, evasive maneuvers, ground attack, interception, and nuclear-bacteriological-chemical scenarios. The levels of pilot G-loading that can be expected in the next-generation EFA fighter are noted. O.C.

A88-46267
**DIAGNOSTICS - AN EFFICIENT METHODOLOGY FOR 'ROTOR
TRACK AND BALANCE'**

P. GADD (Royal Navy, Naval Aircraft Materials Laboratory, Gosport, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 93-97.

An account is given of a novel methodology for the translation of helicopter main-rotor-blade track and lag measurements, in conjunction with the 1/rev vibration vectors, into a diagnosis of faults from which recommendations of maintenance actions for

the rotor system can in turn be based. The performance levels achieved by these diagnostic procedures in an illustrative in-service trial are discussed; future UK Royal Navy adoption of the methodology appears justified in light of the results obtained. O.C.

Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 54, 1987, p. 94-98. In Russian. refs

A new approach to the calculation of contact pressures for the moving components of chassis and other aircraft mechanisms is developed on the basis of the experimental finding that the limiting value of the specific friction force is the determining factor in the failure of the moving surfaces of friction pairs in aircraft components. The method proposed here makes it possible to obtain, early in the design process, reliable estimates of the contact pressures that would guarantee the required load-bearing capacity of the moving components and minimize their mass. V.L.

COST-OF-A-CASSETTE AIR SAFETY

MASAYASU KAWAI (Kyowa Dengyo (Europe), Hoofdrorp, Netherlands) *Aerospace America* (ISSN 0740-722X), vol. 26, Aug. 1988, p. 32-34.

By the end of this century, powerful and compact computers directly integrated with aircraft instruments and programmed to analyze the complex interactions occurring over the entirety of the primary structure will make automated inspection part of routine maintenance; such checkups would then be conducted on site by mechanics, rather than in computer rooms by engineers. A single, properly equipped portable recorder can accept data from up to 224 sources simultaneously, recording them in separate channels of a video cassette for subsequent analysis. Installed recording equipment prompts more frequent monitoring, leading to more dependable and accurate advance warning of system defects, component deterioration, and metal fatigue. O.C.

A88-48704
**AIRCRAFT SERVICING AND MAINTENANCE (2ND REVISED
AND ENLARGED EDITION) [OBSLUZHIVANIE I REMONT
AVIATSIONNOI TEKHNIKI PO SOSTOIANIIU /2ND REVISED
AND ENLARGED EDITION/]**

NIKOLAI NIKOLAEVICH SMIRNOV and ALEKSANDR ABRAMOVICH ITSKOVICH Moscow, Izdatel'stvo Transport, 1987, 272 p. In Russian. refs

Methodological aspects of aircraft maintenance are examined. Consideration is also given to aircraft servicing with reliability monitoring; general questions concerning the development of servicing and maintenance programs; airframe maintenance features; evaluation of maintenance efficiency; and the organizational aspects of servicing and maintenance. TAKEOFF PREDICTIONS FOR POWERED-LIFT AIRCRAFT

Thesis

DOUGLAS A. WARDWELL and DORAL R. SANDLIN Jul. 1988
60 p

(Contract NCC2-236)

(NASA-CR-177491; NAS 1.26:177491) Avail: NTIS HC A04/MF
A01 CSCL 01A

Takeoff predictions for powered-lift short takeoff (STO) and conventional takeoff (CTO) aircraft have been added to NASA Ames Research Center's Aircraft Synthesis (ACSynt) code. The new computer code predicts the aircraft engine and nozzle settings required to achieve the minimum takeoff roll. As a test case, the code predicted takeoff ground rolls and nozzle settings for the YAV-8B Harrier that compared well with measured values. Brief analysis of takeoff performance for an Ejector, Remote Augmented Lift, Hybrid-Tandem Fan, and Vectored Thrust STO aircraft using the new routine will be presented. Author

THE ROLE OF AVIATION TECHNOLOGY IN THE CARIBBEAN

BASIN Final Report, Sep. 1987 - Jul. 1988

ROBERT W. SMITH 1988 99 p

(Contract NCC2-496)

(NASA-CR-183069; NAS 1.26:183069) Avail: NTIS HC A05/MF
A01 CSCL 01A

Aviation technology can play a significant role in the development of the countries of the Caribbean Basin. A variety of applications of rotorcraft in the region, the benefits, both economic and political which can result from utilization of rotorcraft in both a public service and commercial role are presented. A computer simulation of rotorcraft used as emergency medical vehicles is applied to compare and evaluate the advantages of using rotorcraft technology such as civil derivatives of the new tiltrotor. It is concluded that by using a civil derivative of the tiltrotor, significant improvements can be obtained in the level of health service in the region. The potential for cargo and passenger transport applications are currently being investigated and a second computer simulation is being developed to be used to evaluate the potential benefits to be derived from such applications. FIBER OPTICS FOR ADVANCED AIRCRAFT

ROBERT J. BAUMBICK 1988 13 p Presented at the Fiber Optics, Optoelectronics and Laser Applications International Symposium and Exhibition, Boston, Mass., 6-9 Sep. 1988; sponsored by the Society of Photo-Optical Instrumentation Engineers

(NASA-TM-101294; E-4276; NAS 1.15:101294) Avail: NTIS HC
A03/MF A01 CSCL 01B

The increased use of composites makes the digital control more susceptible to electromagnetic effects. In order to provide the protection to the digital control additional shielding will be required as well as protective circuitry for the electronics. This results in increased weight and reduced reliability. The advantages that fiber optic technology provides for advanced aircraft applications is recognized. The use of optical signals to carry information between the aircraft and the control module provides immunity from contamination by electromagnetic sources as well as other important benefits such as reduced weight and volume resulting from the elimination of the shielding and the replacement of metal conductors with low weight glass fibers. In 1975 NASA began work to develop passive optical sensors for use with fiber optics in aircraft control systems. The problem now is to choose the best optical sensor concepts and evaluate them for use. In 1985 NASA and DOD entered into a joint program, Fiber Optic Control System Integration (FOCSI), to look at optical technology specifically for use in advanced aircraft systems. The results of this program are discussed. The conclusion of the study indicated that the use of fiber optic technology in advanced aircraft systems

is feasible and desirable. The study pointed to a lack of available sensors from vendors capable of operating in the adverse environments of advanced aircraft. Author

NUMERICAL STUDY OF INCOMPRESSIBLE VISCOUS FLOW OVER AN ISOLATED AIRFOIL

CHUANGANG GU, XI CHEN, and YONGMIAO MIAO (Xian Jiaotong University, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 190-196. In Chinese, with abstract in English. refs

A finite difference method based on differential-integral equations is presented for the solution of Navier-Stokes equations for incompressible viscous flow. This method is applied to solve the turbulent flows past an isolated airfoil at large angles of attack with separations. The k-epsilon turbulence model, in conjunction with adverse pressure gradient, is utilized to describe and analyze turbulent flow processes. A modified hybrid scheme and a modified pressure correction formula suitable to nonorthogonal coordinates are developed to make the calculation rapidly convergent and simple. Comparison of predications and experiments shows that the agreements of calculated results with experimental data are fairly satisfactory with respect to the pressure distribution of airfoil surface, to the average velocity field, as well as to the point of separation and Reynolds shear stresses. Author

A PRELIMINARY INVESTIGATION OF UNSTEADY PRESSURE MEASUREMENT ON A TWO-DIMENSIONAL WING MODEL

WEIXUN LIN (China Aerodynamics Research and Development Centre, Sichuan, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 226-231. In Chinese, with abstract in English. refs

A preliminary experimental investigation of unsteady pressure measurement technique is presented on two-dimensional wing model with flap oscillating in pitch. The model, equipment and test method are described and some typical results are given. The regularity of the data agrees with results previously obtained, indicating the technique and data processing methods used are feasible. Author

A88-45936#

THE INTERACTION BETWEEN NORMAL SHOCK AND TURBULENT BOUNDARY LAYER IN TRANSONIC FLOW OVER A CURVED WALL

XIAOCHUN LIAN (Northwestern Polytechnical University, Xian, People's Republic of China) and PEIZHENG JIANG (Xian Jiaotong University, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 237-240. In Chinese, with abstract in English. refs

Some calculation results on the interaction between a normal shock and turbulent boundary layer in transonic flow over a curved wall are presented. These results show that the pressure ratio across the shock is lower than the theoretical value, in which the wall curvature plays an important role. All the thickness of boundary layer displacement, moment and energy increase considerably in the interactive region. These increasements principally depend on the pressure ratio across the normal shock. Author

A88-45937#

NUMERICAL CALCULATION FOR THE FLOW FIELD OF TRANSONIC CASCADE WITH INVISCID-VISCOUS INTERACTION METHOD

MANLU LUO and BAINIAN ZHANG (Jiaotong University, Shanghai, People's Republic of China) *Acta Aerodynamica Sinica* (ISSN 0258-1825), vol. 6, June 1988, p. 241-245. In Chinese, with abstract in English. refs

An inviscid-viscous interaction method based on the inviscid time-marching computer code has been employed to calculate the transonic flow field of a two-dimensional cascade. Good agreement with the experimental data has been achieved for several numerical test cases for which the Mach number ranged from subsonic up to supersonic. The computer code works exceedingly well with the transonic flow when there is no strong boundary separation. Author

A88-46047#

STEADY NEWTONIAN FLOW OVER TWO-DIMENSIONAL AIRFOILS

HAMDI T. HEMDAN (King Saud University, Riyadh, Saudi Arabia) Japan Society for Aeronautical and Space Sciences, *Transactions* (ISSN 0549-3811), vol. 31, May 1988, p. 18-28. Research supported by King Saud University. refs

Closed-form solutions for Newtonian flow past two-dimensional thin airfoils with attached shock waves are found in this paper. The work relies on a previous formulation of the hypersonic small disturbance theory and the Newtonian flow theory. Simple results for the shock wave and the surface pressure are given. The analysis extends Cole's (1970) zero-order theory to the effects of nonzero ($\gamma-1$) and finite values of freestream Mach number, where γ is the ratio of the specific heats of the gas. It also improves over a recent work by the present author by getting the shock wave exactly. The results are compared with other approximate methods and the agreement is found to be generally good. TURBULENT DRAG REDUCTION BY PASSIVE MEANS; PROCEEDINGS OF THE INTERNATIONAL CONFERENCE, LONDON, ENGLAND, SEPT. 15-17, 1987. VOLUMES 1 & 2

Conference sponsored by British Aerospace, PLC, USAF, and U.S. Navy. London, Royal Aeronautical Society, 1987, p. Vol. 1, 252 p.; vol. 2, 352 p. For individual items see A88-46228 to A88-46249.

The present conference discusses turbulent drag reduction research at NASA Langley, direct total-force measurements of large eddy breakup (LEBU) device performance, the passive temperature contamination study of LEBU-modified turbulent

boundary layers, the modeling of turbulent boundary layers manipulated with thin outer layer devices, and the boundary layer integral parameters and net drag reduction results of a novel method of calculating the boundary layer characteristics downstream of flow manipulators. Also discussed are the mechanism of viscous drag reduction by streamwise-aligned riblets, transonic speed results for riblet aerodynamic effects, organized flow features in boundary layer turbulence, turbulence-reduction on swept leading edges, and off-design condition performance penalties for riblets. O.C.

TURBULENT DRAG REDUCTION RESEARCH AT NASA LANGLEY - PROGRESS AND PLANS

S. P. WILKINSON, J. B. ANDERS, B. S. LAZOS, and D. M. BUSHNELL (NASA, Langley Research Center, Hampton, VA) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 1. London, Royal Aeronautical Society, 1987, p. 1-32. refs

Prospective research efforts planned at NASA-Langley in view of results obtained to date in passive turbulent drag reduction experiments are discussed. It has been established that conventional flow-aligned riblets are effective even in the presence of a degree of flow inclination and pressure gradients, and at transonic speeds. No increase in net drag reduction is expected from nonconventional riblet geometries. Large eddy breakup devices promise drag reductions in the 8-15 percent range. Heat transfer-augmentation, noise-reduction, turboprop/fuselage interaction noise reduction, are other advantages expected from this line of research. O.C.

A88-46229

A STUDY OF LEBU PERFORMANCE BY DIRECT TOTAL-FORCE MEASUREMENTS

D. I. A. POLL (Manchester, Victoria University, England) and P. G. WESTLAND (Cranfield Institute of Technology, England) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 1. London, Royal Aeronautical Society, 1987, p. 33-44. refs

The performance of tandem ribbon boundary layer manipulators has been investigated experimentally. Tests have been conducted on a large thin plate with fully turbulent boundary layers on both sides. The aerodynamic loads on the plate have been measured with a sensitive force balance. By noting force differences it has been possible to deduce the basic drag of the manipulating ribbons, the effect of the ribbons on the skin friction drag of the plate, and the net drag change of the total system when manipulators are introduced into the boundary layers. Distributions of local wall shear have been estimated by the Preston-tube method. A parametric study has been performed to determine the effect of ribbon height and ribbon separation on net drag. The momentum thickness Reynolds number for the undisturbed boundary layer was varied from 1500 to 2100 at the location of the upstream ribbon. Although the ribbons had a significant effect on the distribution of skin friction over the test plate, no net drag reduction was observed. Author

USE OF LEBU-DEVICES FOR DRAG REDUCTION AT FLIGHT CONDITIONS

A. BERTELTRUD (High Technology Corp., Hampton, VA; Flygtekniska Forsoksanstalten, Bromma, Sweden) and R. D. WATSON (NASA, Langley Research Center, Hampton, VA) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 1. London, Royal Aeronautical Society, 1987, p. 213-249. refs

The practical aspects of drag reduction using LEBU (large-eddy break-up) devices, turbulence manipulators, etc. in flight are discussed with the help of experience from previous flight tests.

02 AERODYNAMICS

These tests have shown that appreciable reductions in local skin friction exist under flight conditions, and that the turbulence-manipulating effects can be found for swept tandem devices in transonic as well as supersonic flows. The unsteady loads experienced with the devices are discussed in connection with the frequencies occurring in this type of real flight conditions.

DRAG REDUCTION PERFORMANCE ON RIBLET SURFACES AND THROUGH OUTER LAYER MANIPULATORS

E. COUSTOLS, J. COUSTEIX, and J. BELANGER (ONERA, Centre d'Etudes et de Recherches de Toulouse, France) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 250A-289. refs

Hot wire measurements behind a tandem-type outer flow manipulator configuration employing either thin plate or airfoil profiles have revealed the importance of the manipulator wake in the skin friction drag reduction process. The wake interacts with the large-scale motion of the preexisting turbulence and modifies it; the effect of this process on the mean characteristics of the turbulence boundary layer is to yield a lower momentum thickness curve slope. Attention is given to the compromise that must be negotiated between low flow manipulator drag penalty and the magnitude of the desired skin friction reduction. O.C.

A88-46237

ON THE MECHANISM OF VISCOUS DRAG REDUCTION USING STREAMWISE ALIGNED RIBLETS - A REVIEW WITH NET RESULTS

P. VUKOSLAVCEVIC, J. M. WALLACE, and J.-L. BALINT (Maryland, University, College Park) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 290-309. refs

The aerodynamic effects of riblet surfaces on the mean and fluctuating streamwise velocity field are confined to within about 4 percent of the boundary layer above the bounding surface. The local wall shear stress varies substantially in the spanwise direction, from about 80 percent greater than the smooth plate value at the riblet peak for flow with the same freestream velocity, to nil at the riblet valley. The turbulence intensities and the skewness and flatness factors of the streamwise velocity fluctuation all indicate that the turbulence is nearly suppressed below the grooves' midpoint. O.C.

A88-46240

AN ASSESSMENT OF THE DRAG REDUCTION PROPERTIES OF RIBLETS AND THE PENALTIES OF OFF-DESIGN CONDITIONS

L. GAUDET (Royal Aircraft Establishment, Bedford, England) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 363-376. refs

An assessment is given of the performance of riblets in reducing skin friction in turbulent flow. The data of Sawyer and Winter (1988) are used to develop skin-friction relationships derived from the velocity profile for a turbulent boundary layer as modified by a riblet surface. The maximum percentage drag reduction is shown to vary with Reynolds number. At large values of the nondimensional riblet height, the riblet surface acts as a uniform roughness and a value for the equivalent sand-grain roughness height is given. Examples of the estimated drag reductions which might be achieved for two current aircraft by incorporating riblet surfaces are presented. Author

SOME EXPERIENCES OF RIBLETS AT TRANSONIC SPEEDS

L. C. SQUIRE and A. M. SAVILL (Cambridge University, England) IN: Turbulent drag reduction by passive means; Proceedings of

the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 392-407. Research supported by Rolls-Royce, PLC and SERC. refs

The present investigation of the skin friction drag effects of riblets at high subsonic speeds, for Reynolds numbers (based on the momentum thickness of the undisturbed boundary layer) of about 20,000, gave attention to six different riblet sizes with height h (equal to spacing s) ranging from 0.0009 inches to 0.006 inches. For maximum reduction in skin friction, the optimum riblet scaling, in wall units, is of the order of 40, while for maximum overall drag reduction, riblet size is of the order of 20 wall units; an analysis of the results suggests that this apparent contradiction is associated with a drag force at the leading edge of the riblet surface. O.C.

EXPERIMENTS ON THREE-DIMENSIONAL RIBLETS

D. W. BECHERT (DFVLR, Berlin, Federal Republic of Germany) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 425-431. refs

The drag reduction by three-dimensional riblet surfaces is investigated experimentally. The turbulent wall shear stress is measured directly using a large floating element. This floating element is inserted into a flat plate with zero pressure gradient of the mean flow. The riblet surface consists of about 600,000 tiny sharp-edged fin-like elements in a staggered array on a smooth flat plate. It was hoped that these elements would 'cut' the streamwise vortices in the viscous sublayer which produce the low speed streaks. However, the shear stress measurements do not support conclusively this latter idea. The data look almost exactly like previous data from conventional straight riblets. Drag reduction does occur (6 percent), and it is comparable to that of straight riblets. Finally, the manufacturing technique for these three-dimensional riblet surfaces is described in brief. MODIFICATION OF TURBULENT BOUNDARY LAYER STRUCTURE BY LARGE-EDDY BREAKUP DEVICES

H. M. ATASSI and G. A. GEBERT (Notre Dame, University, IN) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 432-456. refs

(Contract NAG1-662)

The modification of the turbulent boundary layer large-eddy structure by streamlined devices is analyzed using the rapid distortion approximation and unsteady aerodynamic theory. The fluctuating velocity downstream of thin plate and airfoil-shaped devices is calculated throughout the boundary layer for two-dimensional and three-dimensional upstream harmonic disturbances. It is shown that such devices suppress most effectively the fluctuating vertical velocity for a range of reduced frequencies $k(1)$ based on the device chord length. This effect depends on the device geometry and loading, its distance to the wall, and on the upstream disturbance condition. Effective devices suppressing most of the large-scale turbulent energy are such that $k(1)$ varies over the 0.5 to 3.0 range. For airfoil-shaped devices, the device thickness has minimal effect on its performance. On the other hand, lifting devices are more effective than thin plates particularly for two-dimensional disturbances. Author

TURBULENCE REDUCTION ON SWEEPED LEADING EDGES

G. R. SEYFANG (British Aerospace, PLC, Preston, England) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 568-601. refs

Small, robust, and simple passive devices have been developed which can relaminarize swept leading edges that have been contaminated by either the wing root/fuselage junction flow or local roughness particles. A tentative explanation is given for the

flow mechanism permitting these devices to yield this effect. By retrofitting these passive leading-edge devices to winds, empennages and pylons, current aircraft may achieve a 5-percent total aircraft drag reduction; new laminar-flow aircraft could employ greater wing sweep if the devices were incorporated, to yield higher design speeds. It is also suggested that gliding reentry vehicles may undergo less aerodynamic heating, thereby saving on thermal protection system mass. O.C.

LARGE-EDDY SIMULATIONS OF AXISYMMETRIC EXCITATION EFFECTS ON A ROW OF IMPINGING JETS
 MAGDI H. RIZK and SURESH MENON (Flow Research Co., Kent, WA) Physics of Fluids (ISSN 0031-9171), vol. 31, July 1988, p. 1892-1903. refs
 (Contract F49620-85-C-0084)

Numerical simulations of a row of impinging jets are performed. Both the impinging jets and the fountains caused by the collision of the wall jets are modeled in the simulation. The problem considered contains the essential features of twin jets impinging on the ground, simulating the hovering configuration of a vertical takeoff and landing (VTOL) aircraft. The flow is assumed to be governed by the time-dependent, incompressible Navier-Stokes equations. The large-eddy simulation approach is followed. The present study focuses on the motion and dynamics of large-scale structures that have been experimentally observed in jet flows. The behavior of the jets and the fountain caused by the introduction of axisymmetric disturbances at the jet exits are investigated.

INTRODUCTION TO HYPERSONIC AERODYNAMICS - MODELING PROBLEMS [INTRODUCTION A L'AERODYNAMIQUE HYPERSONIQUE - PROBLEMES DE MODELISATION]

J. P. GUIRAUD (ONERA, Chatillon-sous-Bagneux; Paris VI, Universite, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 28 p. In French. refs
 (AAAF PAPER NT-87-02)

Problems in the modeling of hypersonic flow are discussed for the case of the modeling of gas mixtures using the diffusion approximation. In this approximation, only the barycentric movement of the mixture is considered, and the discussion is limited to the internal energy of the mixture. Following a review of the general principles of hypersonic aerodynamics, global models for the prediction of hypersonic flow which are based on partial differential equations are presented. The present models describe the kinetic theory of gases using the Boltzmann equation. Boundary conditions, particularly at the walls, are specified. R.R.

DEVELOPMENT OF CALCULATION METHODS FOR INVISCID HYPERSONIC FLOWS [DEVELOPPEMENT DE METHODES DE CALCUL POUR LES ECOULEMENTS HYPERSONIQUES NONVISQUEUX]

J. L. MONTAGNE (ONERA, Chatillon-sous-Bagneux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 29 p. In French. refs
 (AAAF PAPER NT-87-03)

The second-order shock-capture methods of van Leer (1979), Harten (1984), and Yee (1987) for hypersonic equilibrium real gas flows are investigated, along with generalizations of Roe's (1981) approximate Riemann solver and the flux-vector splitting techniques of Steger and Warming (1981) and van Leer (1982) for a real gas. A one-dimensional Riemann solver can be used to validate the explicit schemes for capturing strong discontinuities in air at equilibrium. Two-dimensional calculations of detached shocks are used to evaluate the efficiency of these schemes. For the implicit algorithm considered, certain parameters which have no effect for low-Mach-number cases are shown to affect convergence in the hypersonic regime. R.R.

PHYSICO-CHEMICAL NONEQUILIBRIUM EFFECTS IN HYPERSONIC FLOWS [LES EFFETS DE NON-EQUILIBRE PHYSICO-CHIMIQUE DANS LES ECOULEMENTS HYPERSONIQUES]

RAYMOND BRUN (Aix-Marseille I, Universite, Marseille, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 21 p. In French. refs
 (AAAF PAPER NT-87-05)

Nonequilibrium effects in hypersonic rarefied-gas flows, characteristic of orbital flight, in which the nonequilibrium parameter is of the same order as the Knudsen number are discussed. Nonequilibrium Eulerian flows are first considered, with special attention given to the classical example of the expanding flow inside supersonic and hypersonic nozzles at elevated enthalpies. Nonequilibrium dissipative flows are then studied, and it is noted for the catalytic case that the state of the boundary layer has little influence upon the heat flux. A chemical-laser example is presented in which two parallel reactant nozzles ducting into the laser cavity produce the necessary chemical reactions. R.R.

FLOW AROUND AND DOWNSTREAM OF POINTED OR BLUNT YAWED CONES IN A MACH 7 OR 5 STREAM [ECOULEMENT AUTOUR ET EN AVAL DE CONES A POINTE VIVE OU EMOUSSEE PLACES EN INCIDENCE DANS UN COURANT A M = 7 ET 5]

J. MARCILLAT and L. SALLES (Aix-Marseille II, Universite, Marseille, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 32 p. In French. refs
 (AAAF PAPER NT-87-10)

Wind tunnel experiments have been performed in order to study the viscous flow induced by pointed or blunt yawed cones in a Mach 7 or 5 stream. The models are placed at an incidence of 0-20 deg with respect to the stream, and the structures of the resulting three-dimensional boundary layer and near wake are characterized. The case where the boundary layer remains laminar is considered. Particular attention is given to the three-dimensional transition to turbulence. Results are presented for the effect of Reynolds number on the recirculation zone downstream of a pointed cone at zero incidence, along with the effect of incidence variations on the static pressure. R.R.

PREDICTION OF THE AERODYNAMIC COEFFICIENTS OF HYPERSONIC VEHICLES USING THE HABP AND SHABP CODES - COMPARISON WITH EXPERIMENTAL RESULTS [PREVISION DES COEFFICIENTS AERODYNAMIQUES DE VEHICULES HYPERSONIQUES PAR LES CODES HABP ET SHABP - COMPARAISONS AVEC L'EXPERIENCE]

M. LECUYER (ONERA, Chatillon-sous-Bagneux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 42 p. In French. refs
 (AAAF PAPER NT-87-13)

The HABP (hypersonic arbitrary body program) and SHABP (supersonic-hypersonic arbitrary body program) codes are used to demonstrate the usefulness of approximate and empirical methods for predicting the global aerodynamic coefficients of hypersonic vehicles. Although poorly adapted to local characteristic calculations, the methods are shown to produce very precise results at a high speed. Besides their application to ideal fluids, these methods can take into account viscous effects (such as friction) and hypersonic phenomena (such as real-gas effects, the viscous interaction, and the molecular free zone). HABP and SHABP results are compared with experimental values obtained for a variety of geometries ranging from simple to complex. R.R.

VALIDATION OF METHODS FOR THE CALCULATION OF LOW-REYNOLDS-NUMBER HYPERSONIC FLOW BY WIND TUNNEL TESTS [VALIDATION DES METHODES DE CALCUL D'ECOULEMENTS HYPERSONIQUES A BAS REYNOLDS PAR DES ESSAIS EN SOUFFLERIE]

02 AERODYNAMICS

J. P. BEZ (Aerospatiale, Division Systemes, Les Mureaux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 25 p. In French. (AAAF PAPER NT-87-14)

Global aerodynamic coefficients have been obtained during wind tunnel tests in order to validate Monte Carlo, Navier-Stokes (NS), and parabolized NS (PNS) codes developed for the calculation of high-Mach-number low-Reynolds-number flow. Pseudounsteady NS results are presented, along with the results of PNS equations for the cases of cones, a delta wing, and a cylindroconical shape. Good general agreement is found between calculation results and experimental results for small incidence. It is suggested that the range of applicability of the methods can be extended by performing Monte Carlo calculations for Reynolds numbers $Re_{sub L}$ of not less than 500 and by performing NS and PNS calculations for $Re_{sub L}$ values of less than 40,000. R.R.

A88-46341 **FUNDAMENTAL EXPERIMENTS ON THE PASSIVE CONTROL OF THE TRANSONIC SHOCK/BOUNDARY-LAYER INTERACTION [EXPERIENCES FONDAMENTALES SUR LE CONTROLE PASSIF DE L'INTERACTION ONDE DE CHOC-COUCHE LIMITE EN TRANSSONIQUE]**

BRUNO CHANETZ and THIERRY POT (ONERA, Chatillon-sous-Bagneux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 52 p. In French. refs (AAAF PAPER NT-87-17)

An experimental study has been performed in order to explore the use of passive control of the shock/boundary-layer interaction as a means of improving profile performance at transonic velocities. With the use of the control, it is shown that the normal shock wave which forms when the boundary is impermeable is replaced by a lambda system generally associated with normal interactions with extended separation. In the control zone, the boundary layer is found to thicken significantly and to undergo a strong destabilization process, resulting in an increase in momentum thickness. This behavior is related to an increase in friction drag. R.R.

A88-46344 **STUDY OF THE REDUCTION OF FRICTION AND PRESSURE FLUCTUATIONS DOWNSTREAM OF 'AVIATION PROFILE'-TYPE MANIPULATORS IN TANDEM [ETUDE DE LA REDUCTION DU FROTTEMENT ET DES FLUCTUATIONS DE PRESSION EN AVAL DE MANIPULATEURS DE TYPE 'PROFILE AVIATION' EN TANDEM]**

P. OLIVERO, P. BALLY, J. A. ASTOLFI, and B. E. FORESTIER Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 21 p. In French. refs (AAAF PAPER NT-87-20)

Boundary layer manipulators have been tested in the turbulent boundary layer of a flat plate for a Reynolds number of 2500. In the present experimental arrangement, NACA 0009 profiles are placed in tandem according to an optimal configuration. The results show a relative friction reduction of up to 20 percent downstream of the manipulators. The rms pressure fluctuations are reduced 20 percent for the natural boundary layers relative to the manipulated boundary layer. A negative angle of incidence between the manipulators is found to significantly increase the pressure fluctuations at low frequencies. R.R.

A88-46346 **DRAG REDUCTION IN TWO-DIMENSIONAL FLOW BY VORTEX EMISSION CONTROL USING CAVITIES [REDUCTION DE TRAINEE EN ECOULEMENT BIDIMENSIONNEL PAR CONTROLE DE L'EMISSION TOURBILLONNAIRE A L'AIDE DE CAVITES]**

E. POULAIN (ONERA, Chatillon-sous-Bagneux; Lille I, Universite, Villeneuve d'Ascq, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 52 p. In French. refs (AAAF PAPER NT-87-22)

An experimental investigation of subsonic drag reduction in

two-dimensional flow by wake control using cavities is presented. Rocket models with two-dimensional cavities in their tail-ends were tested for a variety of cavity geometries. Optimum drag reduction was achieved for stall angles of between 16 and 20 deg. The cavity depth and shape was found to be less important than cavity opening size in reducing drag. It is suggested that drag reduction is related to unsteady phenomena observed near the cavities such as the periodic ejection of vortices at the cavity resonant frequency. Further increases in drag reduction are found when two cavities are placed in series. R.R.

A88-46347 **DRAG REDUCTION FOR BUSINESS AIRCRAFT [LA REDUCTION DE TRAINEE POUR LES AVIONS D'AFFAIRES]**

J. MAESTRATI Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 36 p. In French. (AAAF PAPER NT-87-23)

Future prospects for drag reduction in business aircraft are addressed, and aircraft modifications are discussed with respect to their impact on aircraft operating range, aircraft velocity, and passenger comfort. Drag sources considered include skin friction, the separations due to the shock/boundary-layer interaction, the equilibration of the aircraft aerodynamic moment, and the unproductive overvelocity produced by lift. It is projected that in the 1990's the fuel consumption of business aircraft will be reduced by about 15 percent due to laminar flow techniques, about 20-35 percent due to engine improvements, about 7 percent due to mass reduction, and about 3 percent due to the use of active control techniques. R.R.

A88-46894 **STEADY-STATE MOTIONS OF A HEAVY AXISYMMETRIC BODY IN A MEDIUM WITH DRAG [OB USTANOVIVSHIKHSIA DVIZHENIYAKH TIAZHELOGO OSESIMMETRICHNOGO TELA V SOPROTVIYALIUISHCHEISIA SREDE]**

V. A. PRIVALOV Akademii Nauk SSSR, Izvestiia, Mekhanika Tverdogo Tela (ISSN 0572-3299), May-June 1988, p. 19-21. In Russian.

A quasi-static interaction model is used to analyze the steady-state plane-parallel translational descent of a heavy axisymmetric body interacting with the medium. It is shown that a critical case occurs in the stability analysis of this type of motion with a finite angle of attack. An instability of the motion is shown which is a 'rough' property of the object considered. The results are pertinent to the study of aerodynamic effects on parachute descent. B.J.

A88-47071# **ENHANCED MIXING OF SUPERSONIC JETS**

T. G. TILLMAN, W. P. PATRICK, and R. W. PATERSON (United Technologies Research Center, East Hartford, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 18 p. Research supported by United Technologies Corp. refs (Contract N00014-85-C-0506) (AIAA PAPER 88-3002)

Novel supersonic nozzle geometry concepts that promote enhanced mixing via the generation of axial vorticity, with potential applications in jet exhaust noise reduction and improved flow distribution within engine combustors, have been experimentally studied for the case of jet mixing conditions typical of turbofan engine operation. Jet total temperature, total pressure, static pressure, and velocity distributions, were measured to characterize the mixing process for baseline slot and circular nozzles as well as several mixer nozzles. The axial vortex mixing mechanism previously found to yield rapid mixing in low speed subsonic flows is found to be effective in a supersonic flow environment as well. O.C.

A88-47252# **AN IMPROVED TECHNIQUE FOR THE SOLUTION OF INVISCID TRANSONIC 3D FLOWS**

E. ARAD, R. GORDON, and R. ARIELI (Rafael Armament

Development Authority, Haifa, Israel) IN: Israel Annual Conference on Aviation and Astronautics, 29th, Haifa, Israel, Feb. 25, 26, 1987, Collection of Papers. Haifa, Technion - Israel Institute of Technology, 1987, p. 1-8. refs

A numerical procedure is presented, for simulating transonic flow over finite wings, using the three-dimensional full potential formulation. The equation is written in strongly conservative form, in a body-fitted coordinate system. An improved version of the Strongly Implicit Procedure is used as a relaxation scheme. A comparative study of several commonly used algorithms for two-dimensional and three-dimensional transonic flows is presented. The study clearly indicates the advantage of the new technique over the other methods. Author

CALCULATION OF TRANSONIC FLOW ABOUT WING-BODY-FAIRING BY A FINITE ELEMENT METHOD

A. KOGAN and S. MIGEMI (Israel Aircraft Industries, Ltd., Tel Aviv) IN: Israel Annual Conference on Aviation and Astronautics, 29th, Haifa, Israel, Feb. 25, 26, 1987, Collection of Papers. Haifa, Technion - Israel Institute of Technology, 1987, p. 27-32. refs

This paper presents computational results of flow about wing-body-fairing combination (WBFC) using optimal control with finite element approximation to solve the full potential equation. The space about the WBFC is divided into tetrahedra in such a way that the resulting flux matrix has in some sense minimum band. Application of the Kutta condition for the WBFC is discussed. The artificial viscosity described in a previous paper is extended to this case. Computed C_p on WBFC are presented and compared to wind tunnel results. Author

A MODEL FOR CALCULATING THE AERODYNAMIC EFFECTS OF VORTEX BREAKDOWN ON SLENDER WINGS

JOSHUA ASHENBERG (Rafael Armament Development Authority, Haifa, Israel) IN: Israel Annual Conference on Aviation and Astronautics, 29th, Haifa, Israel, Feb. 25, 26, 1987, Collection of Papers. Haifa, Technion - Israel Institute of Technology, 1987, p. 33-36. refs

This research deals with a new theoretical model for evaluating the effect of vortex breakdown on the aerodynamics of slender wings. The potential flow and the slenderness assumptions were adopted, and a model for the wing aerodynamics was developed. The vortex breakdown phenomenon was represented by a distribution of two-dimensional sources along the vortex axis. The model was solved numerically for several delta wings, and the pressure distribution and lift were compared with wind tunnel results. Author

A NEW ROBUST 3-D TRANSONIC WING DESIGN PROGRAM UTILIZING DIRICHLET-TYPE BOUNDARY CONDITIONS

B. EPSTEIN (Israel Aircraft Industries, Ltd., Tel Aviv) IN: Israel Annual Conference on Aviation and Astronautics, 29th, Haifa, Israel, Feb. 25, 26, 1987, Collection of Papers. Haifa, Technion - Israel Institute of Technology, 1987, p. 41-46. refs

In this paper a new computer program for three-dimensional transonic wing design is presented. Based on the full potential approach, it is suitable for solving the inverse aerodynamic problem of determining wing geometry according to given pressure distribution. Dirichlet-type boundary conditions are utilized to get a new flow-field which provides a new geometry of the wing. New approach to some principal points of the method (such as trailing-edge closure and leading-edge potential value definition) is suggested. This approach gives the opportunity to adjust trailing edge gaps independently at all the span stations at once, thus dramatically reducing the time of the whole computation compared to the traditional approach. The program provides a fast and robust means for practical three-dimensional transonic wing design. An example of the modification of a transonic wing is presented, together with numerical results. THE ASYMMETRIC PAIR OF VORTICES ADJACENT TO A SPINNING CYLINDER - A SMALL PERTURBATION SOLUTION

G. IOSILEVSKII and A. SEGNER (Technion - Israel Institute of Technology, Haifa) IN: Israel Annual Conference on Aviation and Astronautics, 29th, Haifa, Israel, Feb. 25, 26, 1987, Collection of Papers. Haifa, Technion - Israel Institute of Technology, 1987, p. 75-82. refs

A small perturbation of a previously obtained solution in which a vortex pair is asymmetric in circulation only, while remaining equidistant from a cylinder, is presently used to obtain the loci of a pair of asymmetric vortices in the wake of a two-dimensional cylinder spinning in an incompressible potential crossflow. The vortices' respective circulations are obtained as functions of mean distance from the cylinder, and of cylinder spin rate. Four modes of vortex displacement from the symmetric position are noted for a given mean distance of the vortices from the cylinder. A novel asymmetric solution for the vortex pair is found for the nonspinning cylinder. O.C.

FAST EULER SOLVER FOR TRANSONIC AIRFOILS. I - THEORY. II - APPLICATIONS

ANDREA DADONE (Bari, Universita, Italy) and GINO MORETTI (GMAF, Inc., Freeport, NY) AIAA Journal (ISSN 0001-1452), vol. 26, April 1988, p. 409-424. refs (Contract NAS2-12355)

Equations written in terms of generalized Riemann variables are presently integrated by inverting six bidiagonal matrices and two tridiagonal matrices, using an implicit Euler solver that is based on the lambda-formulation. The solution is found on a C-grid whose boundaries are very close to the airfoil. The fast solver is then applied to the computation of several flowfields on a NACA 0012 airfoil at various Mach number and alpha values, yielding results that are primarily concerned with transonic flows. The effects of grid fineness and boundary distances are analyzed; the code is found to be robust and accurate, as well as fast. O.C.

ON NON-LINEAR VORTEX LATTICE METHOD FOR WINGS AT LARGE ANGLE OF ATTACK IN STEADY, UNSTEADY FLOW

ZHENG YIN YE, LINCHENG ZHAO, and YONGNIAN YANG (Northwestern Polytechnical University, Xian, People's Republic of China) Northwestern Polytechnical University, Journal (ISSN 1000-2758), vol. 6, July 1988, p. 323-330. In Chinese, with abstract in English. refs

The steady and unsteady nonlinear loads of wings at large angle of attack are calculated using a form of the nonlinear vortex lattice method (NLVLM). The location of the separation line at the sharp leading edge, the relaxation factor added in wake-forming, the length of the shed vortices, and other significant parameters are addressed. For strake wings, separation is treated using unsteady NLVLM. It is shown that the separation line at the leading edge must be selected more carefully. For steady subsonic flow, the wake is determined by the moving vortices shed from a wing after the wing starts impulsively from rest. Numerical results show that the calculative results agree closely with experimental data. O.C.

A88-47771* Purdue Univ., West Lafayette, Ind. PREDICTION OF OSCILLATING THICK CAMBERED AEROFOIL AERODYNAMICS BY A LOCALLY ANALYTIC METHOD

HSIAO-WEI D. CHIANG and SANFORD FLEETER (Purdue University, West Lafayette, IN) International Journal for Numerical Methods in Fluids (ISSN 0271-2091), vol. 8, Aug. 1988, p. 913-931. USAF-NASA-sponsored research. refs

The effects of mean-flow incidence, airfoil camber, and airfoil thickness on the incompressible aerodynamics of an oscillating airfoil are investigated theoretically, developing and applying a first-order FEM based on locally analytical solutions (LASs). Laplace equations are used to describe the steady and unsteady harmonic velocity potentials; a body-fitted computational grid is employed; grid-element solutions for both potentials are determined using a numerical LAS method; and the LASs are then assembled to obtain a complete solution. Results for a series of flat-plate and Joukowski

airfoils are presented in extensive graphs and discussed in detail. T.K.

UPSTREAM INFLUENCE AND SEPARATION SCALES IN FIN-INDUCED SHOCK TURBULENT BOUNDARY-LAYER INTERACTION

D. S. DOLLING (Texas, University, Austin) and P. E. RODI Journal of Spacecraft and Rockets (ISSN 0022-4650), vol. 25, March-Apr. 1988, p. 102-108. refs

An experimental study has been made of the effects of leading-edge geometry on the upstream influence and separated flow length scales in fin-induced shock wave turbulent boundary-layer interaction. The fins used had wedge-shaped, hemicylindrical and elliptic leading edges and were tested under adiabatic conditions at Mach 4.9. The primary objective was to determine if the length scales generated by different leading edges could be understood within a common framework. To a first approximation the normalized centerline length scales correlate with fin leading-edge drag coefficient. Attempts to correlate additional data at Mach 1.98 and 2.48 from other studies resulted in a reasonable correlation for upstream influence, but that for the separation length showed a clear influence of Mach number. The fact that the upstream influence can be reasonably well correlated in this form lends further support to the view that large-scale three-dimensional vortical separated flows of this type may be largely inviscid dominated. STAGNATION FLOW FIELD ANALYSIS FOR AN AEROASSIST FLIGHT EXPERIMENT VEHICLE

ROOP N. GUPTA (Scientific Research and Technology, Inc., Hampton, VA) and ANN L. SIMMONDS (NASA, Langley Research Center, Hampton, VA) AIAA, Thermophysics, Plasmadynamics and Lasers Conference, San Antonio, TX, June 27-29, 1988. 16 p. refs

(Contract NAS1-17919)

(AIAA PAPER 88-2613)

Continuum methods are used to analyze the stagnation flow field of the aeroassist flight experiment (AFE) vehicle. For the lower altitude portion of an AFE trajectory, the viscous shock-layer equations are employed. At higher altitudes, the full Navier-Stokes equations with chemical nonequilibrium and surface slip are used. Particular attention is given to the effect of surface catalyticity on surface heating, electron number density, and flow field structure. K.K.

COMPARISON OF NUMERICAL METHODS FOR THE CALCULATION OF SUPERSONIC NOZZLES [SRAVNENIE CHISLENNYKH METODOV RASCHETA SVERKHZVUKOVYKH SOPL]

IU. V. GORA, S. M. IVANOV, and A. A. LENDA Kosmicheskaya Nauka i Tekhnika (ISSN 0321-4508), no. 2, 1987, p. 31-36. In Russian. refs

Integral and local parameters obtained by the Godunov, Mac Cormack, and Kolgan marching methods are compared for two axisymmetric Laval nozzles, contoured by the method of characteristics. Two formulations of the Euler equations with respect to the Cartesian components of the momentum are used for these methods. The advantages of strong conservative difference schemes over weak ones are shown. B.J.

THREE-DIMENSIONAL PERTURBATION EVOLUTION IN A BOUNDARY LAYER WITH A PRESSURE GRADIENT [RAZVITIE PROSTRANSTVENNYKH VOZMUSHCHENII V POGRANICHNOM SLOE S GRADIENTOM DAVLENIIA]

V. M. GILEV, A. V. DOVGAL', IU. S. KACHANOV, and V. V. KOZLOV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), May-June 1988, p. 85-91. In Russian. refs

Experimental data on the three-dimensional stability of a boundary layer with a pressure gradient obtained in a low-turbulence subsonic wind tunnel are reported. The evolution of a three-dimensional harmonic (with respect to time) wave packet in the boundary layer of a wing model is examined, and the resulting amplitude-phase distributions of pulsations in the wave packet are investigated using Fourier analysis. The effect of the pressure gradient on the evolution of the three-dimensional spectral components of the perturbations and flow dispersion characteristics are analyzed. V.L.

A STUDY OF NONSTATIONARY SEPARATED FLOWS OVER DEPRESSIONS [ISSLEDOVANIIE NESTATSIONARNYKH SRYVNYKH TECHENII NAD VYEMKAMI]

L. G. GVOZDEVA, I. P. LAGUTOV, D. K. RAEVSKII, A. I. KHARITONOV, and I. L. SHAROV Akademiia Nauk SSSR, Izvestiia, Mekhanika Zhidkosti i Gaza (ISSN 0568-5281), May-June 1988, p. 185-191. In Russian. refs

The propagation of a plane shock wave over a shallow rectangular depression normal to the wave propagation direction is investigated experimentally by analyzing schlieren and interference patterns and by using piezotransducers to measure pressure. The nonstationary interaction of the shock wave with the depression and quasi-stationary flow of a hot gas past the depression in the wake of the shock wave are examined with reference to experimental results obtained in the Mach range 1.2-5.0 at initial pressures of 600-29,000 N/sq m. The results obtained are also compared with wind tunnel data obtained at similar Re numbers. V.L.

METHODS OF ANALOGY IN THE AERODYNAMICS OF FLIGHT VEHICLES [METODY ANALOGII V AERODINAMIKE LETATEL'NYKH APPARATOV]

AL'BERT OSKAROVICH DITMAN, VIKTOR DMITRIEVICH SAVCHUK, and IOSIF RAFAILOVICH IAKUBOV Moscow, Izdatel'stvo Mashinostroenie, 1987, 152 p. In Russian.

The electromagnetic, electrohydrodynamic, and gas-hydraulic analogy methods are considered. Attention is given to the possibility of applying methods of four-dimensional geometrical physics to the aerodynamics of flight vehicles. Lorentz transformations are used to derive similarity relationships for subsonic and supersonic flow past bodies. The details of analog simulation are outlined, and the appropriate analog devices are described. B.J.

COMPUTER ANALYSIS OF THE EFFECT OF THE LOCATION OF THE VERTICAL TAIL SURFACE ON THE STATIC LATERAL STABILITY OF A TAILLESS AIRCRAFT [ISSLEDOVANIIE NA EVM VLIANIIA POLOZHENIIA VERTIKAL'NOGO OPERENIIA NA STATICHESKUII BOKOVUII USTOICHIVOST' LETATEL'NYKH APPARATOV TIPA 'BESKHOVOSTKA']

E. D. KOVALEV and M. M. OVCHAROV Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 54, 1987, p. 3-5. In Russian.

A mathematical model is developed for investigating the influence of the location of the vertical tail surface on the static lateral stability of a tailless aircraft in the case of separated flow past the delta-wing leading edges. It is shown that, as the wing aspect ratio increases, intense vortex filaments are formed which have a powerful effect on the flow past the vertical tail surface. Calculations are compared with experimental data. B.J.

A88-48302
AN EXPLICIT ITERATIVE METHOD FOR DETERMINING THE INTENSITY OF A WING VORTEX SHEET [IAVNYI ITERATSIONNYI METOD OPREDELENIIA INTENSIVNOSTI VIKHREVOGO SLOIA KRYLA]

V. G. LEBED' Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 54, 1987, p. 5-9. In Russian.

The discrete-vortex method for determining the lift properties

of wings is considered. It is shown that the problem of determining lift properties using this method can be reduced to an explicit iterative method for solving a linear system of algebraic equations. The convergence of the method is demonstrated. B.J.

A88-48303
THE EFFECT OF CONTOUR DEFORMATION ON THE WAVE DRAG OF A THIN AIRFOIL [VLIANIE DEFORMATSII KONTURA NA VOLNOVOE SOPROTIVLENIE TONKOGO PROFILIA]

V. I. KHOLIIVKO Samoletostroenie - Tekhnika Vozdushnogo Flota (ISSN 0581-4634), no. 54, 1987, p. 10-14. In Russian.

The linear theory of supersonic flows is used to investigate steady inviscid flow past a thin airfoil with allowance for the deformation of the skin due to its elastic properties under the effect of external aerodynamic loading. General formulas are obtained for calculating variations of the wave drag of the airfoil. Flow past a symmetric airfoil is considered as a calculation example. B.J.

MODELING THE THREE-DIMENSIONAL FLOW THROUGH A SCRAMJET INLET WITH A HYBRID PNS/PPNS CODE

SASAN YAGHMAEE and DONALD W. ROBERTS (Amtec Engineering, Inc., Bellevue, WA) AIAA, SAE, ASME, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 13 p. refs

(Contract N00024-86-C-5156)
 (AIAA PAPER 88-2826)

Scramjet inlet flow fields are modeled using a hybrid flow analysis code, which combines an efficient parabolized Navier-Stokes (PNS) procedure with a partially parabolized Navier-Stokes (PPNS) method. The PPNS option can be activated in regions of subsonic flow where the pressure field is elliptic in the streamwise direction. Two scramjet flow fields are calculated using the hybrid analysis. Good agreement is exhibited between the calculated results and the experimental data. Author

BLUNT-BODY FLOW SIMULATIONS

K. M. PEERY and S. T. IMLAY (Amtec Engineering, Inc., Bellevue, WA) AIAA, SAE, ASME, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 16 p. refs
 (AIAA PAPER 88-2904)

An efficient computational procedure is presented for two-dimensional and axisymmetric blunt body flow calculations. The procedure is based on an implicit upwind differencing method with automatic mesh adaption and solution control to improve its reliability and ease of use. Inefficiencies due to transient flow evolution are minimized by using surface fits for the initial flow field, and by using a graduated grid procedure. Surface pressures and heat transfer rates are presented for spherical and cylindrical blunt bodies at Mach 6 and 8, including a type IV shock/shock interaction. An unusual numerical phenomenon was encountered with the use of Roe's flux difference scheme in the region of the stagnation streamline in the bow shock; a satisfactory remedy is demonstrated. A BLOCK SPACE-MARCHING METHOD FOR THE NAVIER-STOKES EQUATIONS

SCOTT T. IMLAY and DONALD W. ROBERTS (Amtec Engineering, Inc., Bellevue, WA) AIAA, SAE, ASME, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 11 p. refs (Contract NAS8-37303) (AIAA PAPER 88-3199)

A solution procedure is presented for predominantly supersonic viscous flows. The procedure approximately solves the Navier-Stokes equations by marching blocks of grid points in the streamwise direction and solving the fully elliptic equations within each block. In this manner elliptic effects of limited streamwise extent may be accurately calculated. Results are presented for calculations of a Mach 2 laminar flat-plate shock/boundary-layer interaction, and for a Mach 10 hypervelocity interceptor. Author

DEVELOPMENT OF A THREE-DIMENSIONAL PERTURBATION WAVE PACKET IN THE BOUNDARY LAYER OF A YAWED WING [RAZVITIE PROSTRANSTVENNOGO VOLNOVOGO PAKETA VOZMUSHCHENII V POGRANICHNOM SLOE SKOL'ZIASHCHEGO KRYLA]

A. V. DOVGAL', V. V. KOZLOV, and O. A. SIMONOV (AN SSSR, Institut Teoreticheskoi i Prikladnoi Mekhaniki, Novosibirsk, USSR) Akademiia Nauk SSSR, Sibirskoe Otdelenie, Izvestia, Seria Tekhnicheskie Nauki (ISSN 0002-3434), June 1988, p. 43-47. In Russian. refs

The development of laminar flow perturbations on a wing with a yaw angle of 30 deg is investigated with particular reference to the case where the laminar-turbulent transition occurs in the positive-pressure-gradient area of the boundary layer. Results of low-turbulence wind tunnel experiments are presented; the propagation of harmonic oscillations excited by a local source is studied using hot-wire anemometry. It is shown that the amplification of the oscillations responsible for the laminar-turbulent transitions is largely due to the instability of the mean velocity profile. V.L.

SUMMARY OF LOW-SPEED WIND TUNNEL RESULTS OF SEVERAL HIGH-SPEED COUNTERROTATION PROPELLER CONFIGURATIONS

CHRISTOPHER E. HUGHES (NASA, Lewis Research Center, Cleveland, OH) and JOHN A. GAZZANIGA (NASA, Lewis Research Center; Sverdrup Technology, Inc., Cleveland, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 34 p. Previously announced in STAR as N88-24597. refs (AIAA PAPER 88-3149)

The low speed aerodynamic performance characteristics of several advanced counterrotation pusher propeller configurations with cruise design Mach numbers of 0.72 and 0.80 were investigated in the NASA Low Speed Wind Tunnel. The tests were conducted at Mach numbers representative of the takeoff and landing flight regime. The investigation included: (1) the propeller performance characteristics over a range of blade angle settings and rotational speeds at a Mach number of 0.20; (2) the effect on the propeller performance of varying the axial rotor spacing and mismatching the power and rotational speeds on the propeller rotors; and (3) determining the reverse thrust performance characteristics at Mach numbers of 0.0, 0.10, 0.15 and 0.20. The results of the investigation indicated that the overall low speed performance of the counterrotation propeller configurations was reasonable. Author

NUMERIC SIMULATION OF PHYSICAL FLOW PHENOMENA

L. E. ERICSSON (Lockheed Missiles and Space Co., Inc., Sunnyvale, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988,

Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 33-41. refs (AIAA PAPER 88-3525)

The standard measure of the accuracy of CFD solutions is presently noted to disguise the fact that the computations do not simulate the flow phenomenon observed in the physical experiment. This is shown in the cases of a 60-deg swept ramp at a freestream Mach number of about 3.0, and the flow field at a freestream Mach number of 12.65 on the windward side of a half-cone/delta-wing configuration. It is concluded that numerical simulation is not possible unless a thorough understanding of the physical flow phenomenon in question is already possessed. O.C.

APPLICATION OF MULTIPLE GRIDS TOPOLOGY TO SUPERSONIC INTERNAL/EXTERNAL FLOW INTERACTIONS

M. KATHONG, S. N. TIWARI (Old Dominion University, Norfolk, VA), and R. E. SMITH (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 126-137. refs (Contract NCC1-68) (AIAA PAPER 88-3568)

For many aerodynamic applications, it is very difficult to construct a smooth body-fitted grid around complex configurations. An approach, called 'multiple grids' or 'zonal grids', which subdivides the entire physical domain into several subdomains, is

used to overcome such difficulties. The approach is applied to obtain the solutions to the Euler equations for the supersonic internal/external flow around a fighter-aircraft configuration. Steady-state solutions are presented for Mach 2 at 0, 3.79, 7, and 10 deg angles-of-attack. The problem of conservative treatment at the zonal interfaces is also addressed. Author

UNSTEADY DELTA-WING FLOW COMPUTATION USING AN IMPLICIT FACTORED EULER SCHEME

OSAMA A. KANDIL and H. ANDREW CHUANG (Old Dominion University, Norfolk, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 248-255. refs (Contract NAG1-846; NAG1-648) (AIAA PAPER 88-3649)

The conservative unsteady Euler equations for the flow relative motion in the moving frame of reference are used to solve for the steady and unsteady flows around sharp-edged delta wings. The resulting equations are solved by using an implicit approximately-factored finite-volume scheme. Implicit second-order and explicit second- and fourth-order dissipations are added to the scheme. The boundary conditions are explicitly satisfied. The grid is generated by locally using a modified Joukowski transformation in cross-flow planes at the grid chord stations. The computational applications cover a steady flow around a delta wing whose results serve as the initial conditions for the unsteady flow around a pitching delta wing about a large angle of attack. The steady results are compared with the experimental data and the periodic solution is achieved within the third cycle of oscillation. Author

SURFACE PRESSURE FLUCTUATIONS DUE TO IMPINGING VORTICAL FLOWS UPON AN AIRFOIL

D. J. LEE (NASA, Ames Research Center, Moffett Field, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 303-310. refs (AIAA PAPER 88-3657)

A vortical flow impinging upon an airfoil is studied for the case of a strong vortical flow passing close by the airfoil leading and trailing edge. The vortical flow, having a nonuniform vorticity distribution in the core, is distorted and splits as it nears the leading edge of the airfoil. Significant pressure fluctuation occurs near the leading edge, which becomes a source of noise and vibration. A vortex method and a panel method are used to calculate the highly nonlinear, unsteady and rotational flow during the interaction. The flow is assumed to be two dimensional,

incompressible and inviscid. The nonuniform vorticity in the vortex core is represented by multiple, discrete vortex elements whose strengths are variable depending on the initial velocity profile. Detailed surface pressure and vortex velocity vectors are calculated. The surface pressure is decomposed into quasi-steady and unsteady pressure, sometimes called 'impulsive pressure'. The first time derivative of the pressure related the strength of the noise, and its r.m.s. values are also calculated. Author

DIRECT DRAG MEASUREMENT ON THIN-ELEMENT RIBBLETS WITH SUCTION AND BLOWING

STEPHEN P. WILKINSON (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 362-367. refs (AIAA PAPER 88-3670)

Turbulent, direct drag has been measured for a series of riblet models in air with continuous, low-level suction or blowing applied through narrow streamwise slots located at the peak, base, or valley of the rectangularly shaped riblets. Riblet spacing was approximately that of low-speed wall streaks. The models were designed to test whether wall vortices which are known to occur along widely spaced riblets are integral to turbulence production by attempting to alter them with localized suction or blowing. The drag data show trends that are consistent with reduced or enhanced inflectional breakdown of wall vortices. The trends, however, may also be explained by more fundamental mean-flow effects. VISCOUS UNSTEADY GUST AERODYNAMICS OF A FLAT PLATE AIRFOIL

JAMES M. WOLFF and SANFORD FLEETER (Purdue University, West Lafayette, IN) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 410-418. refs (Contract F49620-88-C-0022) (AIAA PAPER 88-3701)

A mathematical model is developed to analyze the unsteady viscous transverse gust aerodynamics of a flat plate airfoil in an incompressible laminar flow at moderate values of the Reynolds number. The steady flow is described by the Navier-Stokes equations. The unsteady viscous flow is assumed to be a small perturbation to this steady viscous flow, with the resulting system of linear partial differential equations coupled to the steady flow field through the unsteady boundary conditions. Solutions for both the steady and unsteady viscous flow fields are obtained by developing locally analytical solutions. For the steady flow, this is accomplished by first locally linearizing the nonlinear convective terms in the Navier-Stokes equations. The significant effects of Reynolds number and reduced frequency on the transverse gust generated unsteady aerodynamics on the airfoil are then demonstrated. Author

NUMERICAL COMPUTATIONS OF TRANSONIC CRITICAL AERODYNAMIC BEHAVIOR

JUBARAJ SAHU (U.S. Army, Ballistics Research Laboratories, Aberdeen Proving Ground, MD) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 435-444. refs (AIAA PAPER 88-4038)

The determination of aerodynamic coefficients by shell designers is a critical step in the development of any new projectile design. Of particular interest is the determination of the aerodynamic coefficients at transonic speeds. It is in this speed regime that the critical aerodynamic behavior occurs and a rapid increase in the aerodynamic coefficients is observed. The

02 AERODYNAMICS

three-dimensional transonic flowfield computations over projectiles have been made using an implicit, approximately factored, partially flux-split algorithm. Use of a composite grid scheme has been made to provide the increased grid resolution needed for accurate numerical simulation of three-dimensional transonic flows. Details of the asymmetrically located shockwaves on the projectiles have been determined. Computed surface pressures have been compared with experimental data and are found to be in good agreement. The pitching moment coefficient, determined from the computed flowfields, shows the critical aerodynamic behavior observed in free flights. Author

AIRCRAFT VORTICES - JUNCTURE, WING, AND WAKE

GEORGE C. GREENE, JOHN E. LAMAR, and L. R. KUBENDRAN (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 492-498. refs (AIAA PAPER 88-3742)

Many real aircraft flows contain regions of three-dimensional separation with vortices. This paper presents selected results for three representative flows: juncture vortex, lifting-wing vortex, and wake vortex. Due to the difficulty of studying vortices, flow visualization was used as a primary research tool. Vortices are found to depend in subtle ways on details of the configuration, Reynolds number, or the environment. Examples showing the effect of filleting on the juncture flow, Reynolds number on the wing flow, and density gradients on the wake flow are presented. Author

EFFECT OF VERTICAL EJECTOR-JET ON THE VORTEX-LIFT OF DELTA WINGS

JOSEPH KATZ (San Diego State University, CA) and DIETER KERN IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 507-511. refs (Contract NCC2-458) (AIAA PAPER 88-3842)

The effect of adding an ejector jet to a 76-deg delta wing was investigated experimentally and theoretically in terms of the resulting longitudinal aerodynamic characteristics. A small-scale wind-tunnel experiment served for the investigation and a simplified vortex lattice model was constructed to simulate the first order effects of this complex flow field. The major benefits of this combined approach over the use of more developed computer schemes lies in the relative ease in tailoring the mathematical model to a new problem. Results of both the wind-tunnel experiment and the theoretical model showed measurable lift loss due to the ejector jet throughout the whole angle-of-attack range, which will intensify at lower flight speeds. Author

VORTEX-DOMINATED SLENDER-WING PROBLEMS - STUDIES BY A POINT-VORTEX METHOD

H. K. CHENG, R. H. EDWARDS, Z. X. JIA, and C. J. LEE (Southern California, University, Los Angeles, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 512-522. refs (Contract AF-AFOSR-85-0318) (AIAA PAPER 88-3744)

The paper discusses analytical and computational simulations of the vortex-dominated flow about a slender wing. Consideration is given to the applicability of the slender-body theory to vortex lift study and to the problem at high angles of attack. Computations for a slender delta wing simulate the vortical eddies produced by leading-edge flaps and confirm their significant increase in strength with moderate angles of attack as observed by Spedding, Maxworthy, and Rignot (1987) on the basis of water channel experiments. It is shown that at least 2/3 to 3/4 of the predicted eddy circulation can be realized. K.K.

A88-48842*# Vigyan Research Associates, Inc., Hampton, Va. **VORTICAL FLOW ANALYSIS FOR F-106B CONFIGURATION**

JENN LOUH PAO (Vigyan Research Associates, Inc., Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 523-530. refs (Contract NAS1-17919) (AIAA PAPER 88-3745)

The three-dimensional Euler aerodynamic method is applied to basic F-106B wing-fuselage geometries over an angle-of-attack range in the subsonic and transonic speeds to examine vortical flow behavior. The use of this method to provide meaningful vortex breakdown information is explored. This Euler solution algorithm uses a C-H mesh with 80625 grid points to represent the flowfield. Contours of axial velocity and total pressure, spanwise surface pressure and velocity vectors at cross flow planes, together with contours of suction pressure and total pressure on the leeward surface of the wing, were used to examine the vortex breakdown details. K.K.

THE VORTEX ROLLUP PROBLEM USING LAMB VORTICES FOR THE ELLIPTICALLY LOADED WING

CHARLES DALTON and XUEGENG WANG (Houston, University, TX) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 531-538. refs (AIAA PAPER 88-3746)

The classical roll-up of the vortex sheet trailing the elliptically loaded wing is examined here. Three factors, each of which contributed in a different, yet influential, manner were included in the analysis: use of Lamb vortices as the discrete vortices, use of a variable time step, and a redistribution of the initial vortex discretization as a variant to the traditional equal-spacing or equal-strength models. A smooth spiral roll-up was obtained for dimensionless times which exceed those of all but one previous investigators by at least a factor of ten without an increase in computation time for similar computers. In addition, very good comparison with the results of previous investigators is obtained for similar parameters. The redistribution of the initial discretization was found to prevent an early concentration of vortices in the spiral as the integration occurs. The spiral was found to form with an equal number of turns as in other calculations, but with less tightness which we attribute to the fact that Lamb vortices were used. Double precision arithmetic was necessary to obtain meaningful results. Author

USE OF MODEL EQUATIONAL SPECIFICATION - A CASE STUDY IN COMPUTATIONAL AERODYNAMICS

DAVID R. POLING, LEO DADONE (Boeing Helicopters, Philadelphia, PA), XIANG GE, and NOAH PRYWES (Pennsylvania, University, Philadelphia) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 605-611. refs (Contract N00014-83-K-0560) (AIAA PAPER 88-3792)

A comparison is made between the use of MODEL versus manual programming in aerodynamics computations. MODEL is a specification language that uses algebraic or boolean equations to express the rules. The problem involves evaluating trajectories of vortices passing by an airfoil and the changes in velocity and pressure distributions over the airfoil. It is found that all maintenance or refinement can be performed in the specification and that it supports very fast prototyping. K.K.

ON THE ORDER OF PANEL METHODS

WALTER FROST (Tennessee, University, Tullahoma) and J. C. A. WANG IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 644-651. refs (AIAA PAPER 88-3798)

A piecewise constant-surface-singularity panel method for the external Neuman boundary value problem was found to be capable of handling airfoils with cusped trailing edges. The formulation only changes the right-hand-side of the systems of equations while retaining the lower order formulation. An accuracy comparable to that obtained with higher order methods can be achieved using the same number of control points. K.K.

EXPERIMENTS ON THE FORCED WAKE OF AN AIRFOIL

K. STUBER and M. GHARIB (California, University, La Jolla) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 723-730. DARPA-sponsored research. refs (Contract N00014-86-K-0758) (AIAA PAPER 88-3840)

An experimental effort has been made to understand the nature of an airfoil wake whose oscillation frequency is controlled by the introduction of an external perturbation. The waves are introduced into the airfoil top and bottom surfaces' boundary layers by strip heaters; attention to the linear and nonlinear interactions of these wake waves has resulted in observation of three modes of interaction: (1) frequency locking, in which the vortex-shedding frequency is the same as the forcing frequency; (2) quasiperiodic vortex interaction, in which periodic clusters of vortices are observed in the wake; and (3) chaotic vortex interaction, in which the wake vortices exhibit a three-dimensional random structure. O.C.

CONTROL OF SUPERSONIC INTERSECTION FLOWFIELDS THROUGH FILLETING AND SWEEP

B. LAKSHMANAN, S. N. TIWARI (Old Dominion University, Norfolk, VA), and M. Y. HUSSAINI (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 746-759. refs (Contract NAG1-530) (AIAA PAPER 88-3534)

The problem of supersonic flow control using fillets and sweep for a wing/body junction has been investigated numerically using a three-dimensional Navier-Stokes code which employs the

MacCormack time-split finite-volume technique. An elliptic grid generation technique with direct control over spacing has been incorporated for constructing the grid at a filleted wing/body junction. The computed results for pressure distribution, particle paths, and limiting streamlines on the flat plate and fin surface for a swept fin show a decrease in the peak pressure on the fin leading edge and in the extent of the separated flow region. Moreover, the results for the filleted juncture clearly show that the flow streamline patterns lose much of their vortical character with proper filleting. It is demonstrated that fillets with a radius of 3.5 times the fin leading edge diameter are required to weaken the usual necklace vortex interaction. Author

PASSIVE CONTROL PLATE FOR SHOCK-BOUNDARY LAYER INTERACTIONS

WESLEY L. GOODMAN and E. LEON MORRISSETTE (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 760-767. refs (AIAA PAPER 88-3537)

Computational and experimental results are presented for a passive method capable of reducing or completely eliminating the separation region in shock-boundary layer interactions of the type that can result in severe performance degradation due to flow separation in supersonic and hypersonic inlets. The method involves the placement of an embedded plate in the outer portion of the boundary layer, parallel to the wall, so that the incident shock will impinge upon, and be reflected from, its surface. This will lower the pressure gradient in the low-momentum, near-wall region. A porous control plate's effect has also been investigated. O.C.

UNSTEADY WING THEORY - THE KARMAN/SEARS LEGACY

JAMES E. MCCUNE (MIT, Cambridge, MA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 774-784. refs (Contract AF-AFOSR-86-157) (AIAA PAPER 88-3539)

A development history is presented for computational prediction methods in unsteady wing aerodynamics, from the field's inception in the 1920's under the influence of Prandtl, through the work of von Karman, to that of his pupil, Sears. Reflection on 50 years of development in this discipline leads to surprise as to the large portion of the classical linear analysis that can be carried over into the nonlinear regime of wings in conditions of severe maneuvering. In the wake of Scott (1987), attempts have been made to establish a conclusive 'benchmark' comparison with classical linear theory. O.C.

Sponsorship: Service Technique des Programmes Aeronautiques. refs (Contract STPA-86-95001; STPA-86-95011) (AIAA PAPER 88-3540)

An experimental study was made to investigate the unsteady aerodynamic response of an airfoil submitted to simultaneous variations of velocity V and incidence angle α . The experimental simulation was conducted by means of a translation/pitch oscillating device which makes it possible to drive the airfoil in

02 AERODYNAMICS

fore-and-aft motion (V variations) or in pitching motion (α variations), as well as in a combination of these two motions (simultaneous V and α variations). The phase shift Φ between the V and α oscillations can be adjusted from 0 to 360 deg. The present paper is focused on studying the influence of Φ on the two-dimensional unsteady behavior of a NACA 0012 airfoil below and through stall. In both cases, the time-dependent lift and drag coefficients are measured in combined motion for different values of Φ , and the results are discussed and compared to those generated either in pitch or in fore-and-aft motion. Chordwise pressure measurements are also made to document the local unsteady features generated as a function of Φ in the combined motion. Author

THE EFFECTS OF COMPRESSIBILITY ON DYNAMIC STALL

K.-Y. FUNG (Arizona, University, Tucson) and L. W. CARR (NASA, Ames Research Center; U.S. Army, Aeroflightdynamics Directorate, Moffett Field, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers, Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 799-805. refs (Contract AF-AFOSR-83-0071; AF-AFOSR-88-0163; NCA2-196) (AIAA PAPER 88-3541)

In this paper, typical computational predictions and experimental measurements of compressible flow past an airfoil at dynamic stall conditions are studied and compared to develop an insight into the effect of compressibility on dynamic stall. The dependency of the critical Mach number on airfoil leading edge curvature, camber, and angle of attack is investigated. Evidence is presented to show that a local region of supersonic flow occurs on an oscillating airfoil, even for a freestream Mach number as low as 0.2, if the boundary layer remains attached and the angle of attack is sufficiently high; that a shock terminates this local supersonic bubble; and that the vorticity that this shock generates grows rapidly and becomes very unstable as the angle of attack increases beyond the value at which the maximum local flow speed first exceeds the speed of sound. It is suggested that these shock-induced effects compete with the dynamic viscous effects occurring in the boundary layer in determining the onset of separation, which can lead to premature dynamic stall and can significantly reduce the maximum dynamic lift that can otherwise be obtained. UNSTEADY SEPARATION OVER MANEUVERING BODIES

S. F. SHEN and TZUYIN WU (Cornell University, Ithaca, NY) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers, Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 806-814. refs (Contract AF-AFOSR-86-0328) (AIAA PAPER 88-3542)

To understand unsteady separated flows over a maneuvering body requires analysis of the Navier-Stokes equations in a set of body-fixed coordinates. Effects of the extra apparent body forces in various combinations are yet to be systematically explored. The boundary layer equations in body-fixed coordinates, however, retain the usual form except for a Coriolis term which shows up, for instance, in dynamic meteorology as the Rossby number. The Coriolis term is absent in the two-dimensional case. Computed results of unsteady separation, according to the Lagrangian criterion, over a circular cylinder impulsively started into several variable motions, including acceleration, deceleration and rotation, are presented and discussed. UNSTEADY 3D AERODYNAMICS OF SLENDER WINGS IN SEVERE MANEUVER

J. E. MCCUNE and T. S. TAVARES (MIT, Cambridge, MA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers, Part 2.

Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 815-824. USAF-supported research. refs (AIAA PAPER 88-3543)

Recent work on the nonlinear unsteady aerodynamics of two-dimensional airfoils at low Mach number, including the effects of the distortion and/or roll-up of the unsteady wake on the airfoil loading, lift, and moment, encourages the application of the same ideas to the study of the unsteady behavior of slender wings. The problem is three-dimensional but can also be usefully approached in the quasi-two-dimensional (cross-flow) sense. The use of this idea is not intended to preempt the more exact three-dimensional calculations available using lattice methods. Rather, it is hoped for the unsteady case to provide additional insight into the effects of severe and rapid imposed motions, including strong gusts, on wings of low aspect ratio. A feature of this paper is an attempt to maintain and make contact with certain classical analytical techniques of incompressible airfoil theory, and to enhance these with the help of the computer and computer graphics. CONTROL OF THE BOUNDARY LAYER SEPARATION ABOUT AN AIRFOIL BY ACTIVE SURFACE HEATING

LUCIO MAESTRELLO (NASA, Langley Research Center, Hampton, VA), FOROOZ F. BADAVIDI (PRC Kentron, Inc., Hampton, VA), and KEVIN W. NOONAN (U.S. Army, Aerostructures Directorate, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers, Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 830-838. refs (AIAA PAPER 88-3545)

Application of active control to separated flow on the RC(6)-08 airfoil at high angle of attack by localized surface heating is numerically simulated by integrating the compressible two-dimensional nonlinear Navier-Stokes equations solver. Active control is simulated by local modification of the temperature boundary condition over a narrow strip on the upper surface of the airfoil. Both mean and perturbed profiles are favorably altered when excited with the same natural frequency of the shear layer by moderate surface heating for both laminar and turbulent separation. The shear layer is found to be very sensitive to localized surface heating in the vicinity of the separation point. The excitation field at the surface sufficiently altered both the local as well as the global circulation to cause a significant increase in lift and reduction in drag. Author

CENTERLINE MACH NUMBER CHARACTERISTICS OF HIGHLY HEATED FREE JETS

JAN LEPICOVSKY (Lockheed Aeronautical Systems Co., Marietta, GA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers, Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 989-999. refs (Contract NAS3-23708) (AIAA PAPER 88-3612)

This paper describes a detailed experimental study of Mach number centerline characteristics of highly heated free jets. The jet characteristics were obtained at a range of jet Mach numbers from 0.1 to 0.9 and jet total temperatures up to 900 K. The results show that a strong correlation exists between nozzle-exit boundary-layer conditions and free-jet development. It is clear from this investigation that experimental data on free-jet development cannot be meaningfully compared from one facility to another without specific knowledge of nozzle exit conditions. It was concluded that direct effect of the jet operating conditions (elevated flow temperature) on free jet development is much less important than the indirect effect of changed nozzle-exit boundary-layer characteristics. NAVIER-STOKES SOLUTIONS OF TRANSONIC NOZZLE FLOW WITH SHOCK-INDUCED FLOW SEPARATIONS

C. F. SHIEH (Rohr Industries, Inc., Chula Vista, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1008-1015. refs (AIAA PAPER 88-3614)

Transonic turbulent flows inside two-dimensional and conical nozzles have been analyzed by solving two-dimensional Navier-Stokes equations. The governing equations are written in a conservative form of a general curvilinear coordinate system and are solved by a hopscotch numerical method. An algebraic two-layer turbulence model is used in the computation. Good agreement is obtained between the solutions and experimental measurements for all of the cases investigated, including both the forward-thrust and thrust-vectoring cases. Among these cases, a two-dimensional nozzle in a stalled condition, i.e., a reverse flow occurring at the nozzle exit, as well as the case of a supersonic exhaust nozzle with an external flow turning, are of particular interest due to the strong viscous and inviscid flow interaction. Good agreement is achieved between computed and measured pressure distributions. The viscous effects on shock location and shock strength are accurately predicted. Author

STRUCTURE OF A REATTACHING SUPERSONIC SHEAR FLOW

M. SAMIMY (Ohio State University, Columbus) and B. A. K. ABU-HIJLEH IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1016-1021. refs (Contract NAG3-764; N00014-87-K-0169) (AIAA PAPER 88-3615)

A Mach 1.83 fully developed turbulent boundary layer with boundary layer thickness, free stream velocity, and Reynolds number of 7.5 mm, 476 m/s, and 6.2×10 to the 7th/m, respectively, was separated at a 25.4-mm backward step and formed a shear layer. Fast-response pressure transducers, schlieren photography, and LDV were used to study the structure of this reattaching shear flow. The preliminary results show that large-scale relatively organized structures with limited spanwise extent form in the free shear layer. Some of these structures appear to survive the recompression and reattachment processes, while others break down into smaller scales and the flow becomes increasingly three-dimensional. The survived large-scale structures lose their organization through recompression/reattachment, but regain it after reattachment. The structures after reattachment form a 40-45-degree angle relative to the free stream and deteriorate gradually as they move downstream. Author

THE CIRCULATION OF AN AIRFOIL STARTING VORTEX OBTAINED FROM INSTANTANEOUS VORTICITY MEASUREMENTS OVER AN AREA

R. E. FALCO, C. C. CHU, M. H. HETHERINGTON, and C. P. GENDRICH (Michigan State University, East Lansing) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1048-1054. refs (Contract AF-AFOSR-87-0047) (AIAA PAPER 88-3620)

By dissolving a photochromic chemical in an organic liquid and exciting it with ultraviolet light, a colored line can be created anywhere in the liquid. A device has been constructed which divides a laser beam into n lines which are made to intersect to form a grid. Introducing two sets of these lines into the flowing fluid produces a grid of 100-micron colored fluid lines with a mesh spacing of approximately 1 mm. The color change persists long enough so that the grid lines are distorted by the flow before

disappearing. The process is completely nonintrusive. The lines are analyzed by an image processing algorithm to allow the grid intersection points to be located quickly and with high precision. The movement of the intersection points in a unit of time results in temporal gradients of position, which in conjunction with estimates of the circulation around each grid box can be used to obtain the vorticity. Additionally, differencing again across a grid box results in spatial gradients of velocity. Experiments in a Stokes flow indicate that the vorticity can be measured to \pm or $-$ 1/sec. Application to the measurement of the formation of lift on an impulsively started airfoil has been made and compared with known results. Author

A STUDY OF THE ENCOUNTER BETWEEN A HELICAL VORTEX AND A CIRCULAR CYLINDER

N. M. KOMERATH, S. G. LIU, A. G. BRAND, and H. M. MCMAHON (Georgia Institute of Technology, Atlanta) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1055-1063. refs (Contract DAAG29-82-K-0084) (AIAA PAPER 88-3622)

Flows around rotary-wing configurations involve unsteady interaction phenomena between curved vortices and solid surfaces. An attempt has been made here to capture the details of such an interaction using synchronized flow visualization and measurements of velocity and surface pressure fluctuations. A two-bladed rotor in a wind tunnel is used to generate a vortex-dominated wake which interacts periodically with an instrumented hemisphere-cylinder body. The core of the rotor tip vortex is visualized using a laser sheet until it reaches the surface of the cylinder. Velocity profiles before, during, and after the interaction are measured using a laser velocimeter. The motion of the vortex is qualitatively consistent with the 'image vortex' model. Upon impingement, it changes into two vortices of opposite senses of rotation. The remains of the original vortex continue along a retarded trajectory, and appear to rise from the surface as a vortex with a much smoother core velocity profile, while the secondary vortex is convected rapidly downstream. The pressure variation exhibits high stagnation pressures and low core static pressures, as expected. High axial velocities and velocity gradients are observed in the vortex core. Author

LIQUID CRYSTALS FOR UNSTEADY SURFACE SHEAR STRESS VISUALIZATION

DANIEL C. REDA (Sandia National Laboratories, Albuquerque, NM) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1069-1072. refs (Contract DE-AC04-76DP-00789) (AIAA PAPER 88-3841)

Oscillating airfoil experiments were conducted to test the frequency response of thermochromic liquid crystal coatings to unsteady surface shear stresses under isothermal-flow conditions. The model was an NACA-0015 airfoil, exposed to an incompressible flow at a freestream Reynolds number (based on chord) of 1.14×10 to the 6th. Angle-of-attack forcing functions were sine waves of amplitude \pm or $-$ 10 deg about each of three mean angles of attack: 0, 10, and 20 deg. Frequencies of oscillation were 0.2, 0.6 and 1.2 hertz, corresponding to reduced frequencies of 0.0055, 0.0164, and 0.0328. Data acquisition was accomplished by video recording. Observations showed the liquid crystal technique capable of visualizing high surface shear stress zones over the stated dynamic range in a continuous and reversible manner. Author

INSTABILITIES IN THE WAKE/MIXING-LAYER REGION OF A SPLITTER PLATE SEPARATING TWO SUPERSONIC STREAMS

02 AERODYNAMICS

SAAD A. RAGAB (Virginia Polytechnic Institute and State University, Blacksburg) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1095-1102. refs (Contract N00014-87-K-0168) (AIAA PAPER 88-3677)

The stability of the laminar wake of a splitter plate is investigated using linear inviscid spatial theory. The two streams are supersonic but have different velocities and temperatures, thus the wake is not symmetric. The basic state is obtained by solving the Navier-Stokes equations using a finite difference code. The equations are solved starting from an assumed initial state, which is given by a surface of discontinuity (i.e. a vortex sheet), and a steady laminar flow is obtained for the three cases considered. The variation of growth rates and phase speeds with frequency are determined. The results show a strong stabilizing effect of the Mach number. Author

GOERTLER VORTICES IN SUPERSONIC BOUNDARY LAYERS
R. E. SPALL and M. R. MALIK (High Technology Corp., Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1103-1110. refs (Contract NAS1-18240) (AIAA PAPER 88-3678)

The problem of Goertler vortices in compressible boundary layers over concave walls is studied by solving parabolic partial differential equations. The numerical scheme used is based upon a fourth-order accurate compact difference scheme. The results show that both the velocity and temperature fluctuations may lead to a Goertler vortex. The vortex growth rates determined from the present method are found to differ somewhat from those given by normal mode solution. The effects of cooling, heating and pressure gradient are also studied. At a Mach number of 3.5, cooling has a small destabilizing effect. The effect of adverse pressure gradient is also found to be destabilizing on a Mach 8 boundary layer. Author

FLOW DEVELOPMENT ON AN AIRFOIL WITH A SHARP TRAILING EDGE STARTED IMPULSIVELY FROM REST
RUBEN ROJAS-OVIEDO (Tuskegee University, AL) and JAMES C. WILLIAMS, III (Auburn University, AL) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1196-1203. Research supported by Auburn University. refs (AIAA PAPER 88-3712)

A study is made of the unsteady boundary layer development on a symmetrical airfoil with a sharp trailing edge (a Karman-Trefftz airfoil) at zero angle of attack, which is impulsively set into uniform motion. The boundary layer development is calculated using a simple implicit finite difference technique. Special attention is paid to the development of the boundary layer near the airfoil trailing edge and to the nature and motion of separation. The results obtained are compared with those obtained earlier in a study of a cusped trailing edge airfoil (a Joukowski airfoil) impulsively set into motion. It is shown that a separation singularity originates at the airfoil trailing edge immediately after the start of the motion and moves forward along the body as time increases, until finally the separation singularity becomes stationary at the steady state separation point. The computed characteristics of the boundary layer near separation support the Moore-Rott-Sears model of unsteady separation. Author

HOT-WIRE MEASUREMENTS OF NEAR WAKES BEHIND AN OSCILLATING AIRFOIL
S. O. PARK, J. S. KIM, and B. I. LEE (Korea Advanced Institute of Science and Technology, Seoul, Republic of Korea) IN: AIAA,

ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1217-1223. refs (AIAA PAPER 88-3715)

An experimental investigation of unsteady wakes behind a sinusoidally pitching airfoil was carried out. Data were taken at mean incidence angles of 0, 2, and 4 deg at reduced frequencies of 0.1 and 0.2. For all the cases, the amplitude of oscillation was 7.4 deg. Ensemble averaged mean velocity and turbulence intensity profiles and the periodic change of semi-wake thickness are presented. The phase lag based on velocity profile was estimated at various downstream stations. The relative time of the occurrence of boundary layer breakdown is discussed in terms of the phase lag characterizing the situation. Pictures of smoke-wire flow visualization at some chosen phases are included to aid in understanding the overall flow characteristics. Author

DESIGN OF LOW REYNOLDS NUMBER AIRFOILS. II
W. PFENNINGER, C. S. VEMURU, S. MANGALAM, and R. EVANGELISTA (Analytical Services and Materials, Inc., Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1305-1319. refs (Contract NAS1-18235) (AIAA PAPER 88-3764)

Low Reynolds number airfoils were designed for high lift-to-drag ratios. Design considerations of low Re-airfoils are discussed and design examples are presented. It is shown that the performance of advance low Reynolds airfoils critically depends on proper laminar separation and transition control for the minimum profile drag coefficient with minimum turbulator device drag. This transition control close to the laminar separation is possible by enforcing transition on the upper surface either directly by means of spanwise rows of three-dimensional roughness elements, bleed or suction holes, or indirectly by means of destabilizing the upper surface boundary layer by means of backward facing surface steps, two-dimensional or zig-zag tapes or weak boundary layer blowing. Pneumatic turbulators are found to be advantageous because they can be adjusted to different external flow conditions better than mechanical ones. R.B.

CHARACTERISTICS OF MULTIPLE SHOCK WAVE/TURBULENT BOUNDARY LAYER INTERACTIONS IN RECTANGULAR DUCTS
BRUCE F. CARROLL and J. CRAIG DUTTON (Illinois, University,

Urbana) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1340-1347. Research supported by University of Illinois. refs

(Contract N00014-85-K-0665)
(AIAA PAPER 88-3803)

Multiple shock wave/turbulent boundary layer interactions in a rectangular duct have been investigated using wall pressure measurements, surface oil flow visualization, and spark Schlieren photography. At Mach 2.45 the shock structure was a neutrally stable pattern of oblique shocks followed by repeated normal shocks with the level of flow confinement having only a small effect on the interaction. At Mach 1.6 the pattern consisted of a bifurcated normal shock followed by weaker unbifurcated normal shocks. At this lower Mach number the interaction was much steadier with the length of the interaction scaling directly with the level of flow confinement. Author

ANALYSIS OF SYMMETRIC WAKE BEHIND A CIRCULAR CYLINDER USING A DIRECT SOLUTION TECHNIQUE AND NEWTON'S METHOD

A. B. RICE (Structural Dynamics Research Corp., Milford, OH), K. N. GHIA, G. A. OSSWALD, and U. GHIA (Cincinnati, University, OH) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1391-1398. refs
(Contract N00014-85-K-0049; AF-AFOSR-87-0074)
(AIAA PAPER 88-3608)

An analysis of the symmetric wake behind a circular cylinder is developed, using the two-dimensional form of the unsteady incompressible Navier-Stokes equations in terms of vorticity and stream function. The conservation-law form of the equations is employed in generalized orthogonal curvilinear coordinates. A fully-implicit direct time-marching scheme consisting of the alternating direction implicit-block-Gaussian elimination (ADI-BGE) technique is employed. This method has overall second-order spatial accuracy and, therefore, avoids the introduction of any artificial viscosity. After the major structure of the flowfield has been established with the direct technique, an algorithm which corresponds to Newton's method is applied to increase the rate of convergence and the accuracy of the solution. The asymptotic flow structure which results from this analysis of the half-cylinder configuration compares favorably with existing numerical and analytical solutions. Author

NAVIER-STOKES ANALYSIS OF THE PERFORMANCE AND FLOW FIELD OF SINGLE AND COUNTER-ROTATION PROPELLERS

R. GANESH RAJAGOPALAN (Iowa State University of Science and Technology, Ames) and RONALD R. FRYE IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1584-1590. Research supported by Iowa State University of Science and Technology. refs
(AIAA PAPER 88-3638)

A novel numerical solution procedure is used to solve the flow over an axisymmetric nacelle and propeller. From known geometric characteristics of the propeller and nacelle and aerodynamic characteristics of the airfoil used for the propeller blades, the performance and all the flow field variables are calculated implicitly by solving the steady, incompressible, laminar, Navier-Stokes equations in an axisymmetric coordinate system. The solid body is represented by blocked off regions in the flow with all three velocity components set to zero. The effect of the spinning propeller blades are time averaged and are introduced through the source terms of the momentum equations. It is observed that the agreement of performance characteristics with experimental data is very good and that the flow field characteristics are qualitatively

correct. Flow field characteristics are displayed with the help of streamlines and contour plots of pressure and tangential velocity.

COMPUTATION OF THREE DIMENSIONAL TRANSONIC FLOW IN A CENTRIFUGAL IMPELLER USING EULER EQUATIONS

M. M. ABDELRAHMAN (Cairo University, Egypt) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p.

02 AERODYNAMICS

1820-1827. refs
(AIAA PAPER 88-3731)

A finite difference computer code is proposed for calculating the three-dimensional, steady, inviscid, transonic flow within the impeller passage of a centrifugal compressor. The starting point is the set of the unsteady Euler equations governing the three-dimensional fluid flow. The equations are simplified by using the steady form of the energy equation and are expressed in a rotating, nonorthogonal curvilinear coordinate system in which the coordinate surfaces coincide with the hub, shroud, inlet, outlet, and blade surfaces of the impeller. The differential equations are integrated over microcontrol volumes associated with each grid node to derive the finite difference equations. These equations are solved by a time-marching technique using an implicit time scheme. A blade-to-blade choked flow is studied as a two-dimensional case and the transonic flow in a centrifugal compressor impeller as a three-dimensional case. C.D.

COMPUTATION AND ANALYSIS OF THE SHAPES OF S1 AND S2 STREAMSURFACES IN A TRANSONIC COMPRESSOR ROTOR

JIALIN ZHANG (Chinese Academy of Sciences, Institute of Engineering Thermophysics, Beijing, People's Republic of China) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1836-1842. refs
(AIAA PAPER 88-3734)

Based on Wu's (1952) stream-surface theory and a solved three-dimensional transonic flowfield of an axial-flow compressor rotor, a method to compute three-dimensional streamlines and stream surfaces in the flowfield has been proposed. The shapes of S1 and S2 stream surfaces have been computed and shown by figures. With these figures, the three-dimensional effects of transonic flow in turbomachinery have been analyzed. The computation and analysis show that there are strong interactions within the flows in subsonic and supersonic stream tubes which make stream surfaces twist and lead to discrepancies between the quasi-three-dimensional and the fully three-dimensional calculations. METHODOLOGY FOR ANALYSIS OF AFTERBODIES FOR THREE-DIMENSIONAL AIRCRAFT CONFIGURATIONS

EUGENE H. MILLER (Grumman Corp., Aircraft Systems Div., Bethpage, NY) Journal of Aircraft (ISSN 0021-8669), vol. 25, May 1988, p. 459-464. refs

Today's modern fighter design, with multifunction nozzles, is

placing an increased emphasis on nozzle/airframe integration. The current tools available to the aircraft designer for aft-end design and evaluation are model test reports, being disseminated mainly by government laboratories, and three-dimensional numerical computation codes. Test data utilization usually is limited by the suitability of the area that has been tested. The second approach, analysis, usually requires time-consuming three-dimensional configuration data input. Recognizing the need for a quicker means of solution, useful in a preliminary design environment, a semiempirical computer methodology for determining three-dimensional aircraft afterbody performance has been developed. The essence of the approach is to construct equivalent bodies of revolution of three-dimensional bodies and then to utilize a straight or hybrid axisymmetric analysis. This approach has been developed for single- and twin-engine axisymmetric and two-dimensional afterbodies. The methodology has been verified by comparisons of afterbody drag and axial and longitudinal pressure distributions. Author

CALCULATION OF LIFT-CURVE SLOPE USING A WING TIP BIASED VORTEX DISTRIBUTION

JAMES D. LOWE (Toronto, University, Canada) *Journal of Aircraft* (ISSN 0021-8669), vol. 25, May 1988, p. 472, 473. refs

The horseshoe vortex model presently used to calculate the lift-curve slope of a flat, untwisted rectangular wing is based on wingtip-biased cascades of vortices modifying a central vortex core. If the cascades are confined to the outer portions of the wing, the lift-curve slope may be calculated to an adequate degree of accuracy over a broad range of aspect ratios, using seven vortex elements. The resulting aerodynamic calculations are not computationally intensive, and attempt to model the qualitative properties of the flow. O.C.

SPANWISE DISPLACEMENT OF A LINE VORTEX ABOVE A WING - A SIMPLE CALCULATION SCHEME

YUNGGUI JUNG and DONALD D. SEATH (Texas, University, Arlington) *Journal of Aircraft* (ISSN 0021-8669), vol. 25, May 1988, p. 476-478. refs
 (Contract DAAG29-84-K-0131)

It is found that, in the case of the low subsonic flow conditions considered, the detailed temporal variation of a wing's trailing vortex sheet due to the deforming vortex has little effect on the motion of the vortex line over the wing surface. Attention is accordingly given to a method based on the lifting-line solution of the spanwise load distribution. The calculated bound vorticity is redistributed along the chord in accordance with 'thin airfoil theory', and surprisingly good results are obtained. O.C.

INTERACTION MECHANISMS BETWEEN TIP LEAKAGE FLOW AND THE PASSAGE VORTEX IN A LINEAR TURBINE ROTOR CASCADE

A. YAMAMOTO (National Aerospace Laboratory, Chofu, Japan) *ASME, Transactions, Journal of Turbomachinery* (ISSN 0889-504X), vol. 110, July 1988, p. 329-338. refs

In order to study the loss generation mechanisms due to the tip-leakage flow in turbine rotor passages, extensive traverse measurements were made of the three-dimensional flows in a low-speed linear cascade for various tip-clearance sizes and for various cascade inlet flow angles (or incidences). Effects of the leakage flow on the cascade downstream flow fields and interactions between the leakage flow and the passage vortices are discussed in detail based on the traverse measurements and flow-visualization tests in terms of secondary flows and the associated losses. Other traverses were also performed of the tip-casting endwall flows both inside and outside the tip-clearance gap using a micro five-hole pitot tube to reveal the axial development of the interaction throughout the cascade passage. Overall loss characteristics of the present high-turning cascade with blunt leading and trailing edges are obtained and compared with those predicted by the Ainley-Mathieson method. Author

A FULL QUASI-THREE-DIMENSIONAL CALCULATION OF FLOW IN TURBOMACHINES

M. RIBAUT (Brown Boveri and Co., Ltd., Baden, Switzerland) *ASME, Transactions, Journal of Turbomachinery* (ISSN 0889-504X), vol. 110, July 1988, p. 401-404. refs

The problem of calculating a three-dimensional flow with three families of two-dimensional solutions is considered. From a throughflow solution and several blade-to-blade solutions the boundary values of a set of transverse solutions are obtained. The resulting overdetermined boundary condition problem is solved by means of a compatibility function defining the divergence of the transverse velocity field. The influence of the latter on the blade-to-blade solution is formulated in two different ways and compared with the experiment. The new method should considerably improve the prediction of three-dimensional cascade flow presenting a large amount of streamwise vorticity in the meridional direction. Author

AERODYNAMICS OF LIFTING BODIES WITH COMBINED TRANSVERSE AND LONGITUDINAL CURVATURE Ph.D.

Thesis
 SHEAM-CHYUN LIN 1987 125 p
 Avail: Univ. Microfilms Order No. DA8729877

Explicit, closed form, approximate analytical results were obtained for hypersonic flow past a body whose cross section deviates slightly from a right circular cone as a result of combined transverse and longitudinal curvature. The results are developed in the framework of hypersonic small disturbance theory and presented in similarity form. The analytic nature of the solution is particularly suitable for conducting parametric design studies of lifting body configurations. By means of these flow field solutions, a new class of waverider configurations can be constructed. The lift and drag and other pertinent characteristics can be determined by means of quadratures. An average skin friction coefficient is used to take the viscous drag into account and to be studied parametrically in a rational basis. The results indicate that combined longitudinal and transverse curvature can be used effectively to efficiently integrate volumetric, propulsion, and aerodynamic requirements for a variety of hypersonic vehicles. The supersonic 2-D flow past an oscillating profile is calculated by means of a method of characteristics. The deformation of the wing chord is considered as well. In order to linearize the problem, amplitudes are assumed small. A linear method of characteristics is obtained with six dependent variables, namely amplitude and phase of the velocity components and of the pressure. Besides the lateral and rotating motion of the wing, two further mode shapes of the uniform unrestrained beam are given. The calculation is carried out for different Mach numbers and different reduced frequencies. Author

NUMERICAL CALCULATION OF SUPERSONIC FLOW BY THE PNS EQUATIONS

MICHIRU YASUHARA and YOSHIKI NAKAMURA *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 43-48 Nov. 1987 *In* JAPANESE; ENGLISH summary
Avail: NTIS HC A12/MF A01

The Parabolized Navier-Stokes (PNS) equations are examined. The Euler equation was previously solved by the finite volume method. The results showed good agreement with experimental results. Then, this was extended to include viscous effect by solving the Navier-Stokes equations, using the Beam-Warming scheme. These results also showed good agreement with the Euler code. Thermal effects on the Shuttle-like body could also be obtained. The PNS equations were employed in order to reduce CPU time. Actually the calculation time was reduced to some thousands as much as the thin layer Navier-Stokes equations. The two cases were calculated. One is a hemisphere cylinder, and the other is a hemisphere-elliptic cylinder at an attack angle. The first case was compared with the time-dependent thin-layer NS equations. The comparison between them was good. The second case showed the clear effect of the attack angle as the turn of the flow from the lower surface to the upper surface. Author

NAVIER-STOKES ANALYSIS OF TRANSONIC TRANSPORT AIRCRAFT EMPENNAGE

YASUHIRO KOSHIOKA, KEISUKE KAMO, and KANICHI AMANO (Japan Aircraft Development Corp., Tokyo.) *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 49-54 Nov. 1987 *In* JAPANESE; ENGLISH summary

Avail: NTIS HC A12/MF A01

Flow field simulations over transonic aircraft empennage were performed based on three-dimensional Navier-Stokes equations. The computations were done for the flow fields of various Mach numbers and angles of attack to investigate the variation of the life curve slope with the Mach number at low angle of attack, and the variation of the lift coefficient with the angle of attack at low Mach number. The value of the lift curve slope obtained by the computations show good agreement with those by experiments. While the difference between computations and experiments looks a little large about lift coefficient verses angle of attack. Author

NUMERICAL SOLUTIONS OF THE EULER EQUATIONS FOR THE FLOW FIELD AROUND COUNTER-ROTATING PROPELLERS

MAKOTO KOBAYAKAWA and MASAHIRO NAKAO (Mitsubishi Heavy-Industries Ltd., Nagoya, Japan) *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 55-63 Nov. 1987 *In* JAPANESE; ENGLISH summary Original language document was announced in IAA as A88-13544

Avail: NTIS HC A12/MF A01

In order to investigate the flow field around the ATP through numerical methods for its optimal design, 3D-Euler equations are most prominent. The flow field around counterrotating propellers in advancing 0.8 Mach is obtained. Two spaces including front and rear blades are solved separately. The interaction between both blades are taken into the calculation by the connecting surfaces. The noniterative implicit ADI scheme is used in order to solve Euler equations. The periodic steady and averaged steady solutions are obtained. The latter is simplified by averaging the variables at the connecting surface. This shortens the calculation time to one-third compared with the periodic steady analysis which simulates the relative motion of the blades exactly. Numerical calculations are performed for two counter rotating ATP's with SR-1 and SR-3 blades. Both results show that they are similar to each other, and the propeller efficiencies increase compared with single rotating ATP with the same blades. Author

COMPUTATION OF FLOW AROUND NACA0012 AIRFOIL AT HIGH ANGLE OF ATTACK

YOSHIFUMI SHIDA and KUNIO KUWAHARA *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 73-79 Nov. 1987 *In* JAPANESE; ENGLISH summary Previously announced in IAA as A87-42448

Avail: NTIS HC A12/MF A01

Transonic flow around a NACA0012 airfoil at high angle of attack is simulated by solving the two-dimensional Navier-Stokes equations. The block pentadiagonal matrix scheme is employed. Periodic phenomena of shock-wave vortex interaction are observed. For comparison, computation of subsonic flow was done. Small vortices are observed between the leading edge and the center of the chord. Author

NUMERICAL SIMULATION OF VISCOUS FLOWS OVER TRANSONIC AIRCRAFT CONFIGURATIONS

SUSUMU TAKANASHI, MASAHIRO YOSHIDA, KOZO FUJII, KISA MATSUSHIMA (Fujitsu Ltd., Tokyo, Japan), and SHIGERU OBAYASHI *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 85-89 Nov. 1987 *In* JAPANESE; ENGLISH summary

Avail: NTIS HC A12/MF A01

Numerical simulation of compressible viscous flow fields is performed for a transonic transport configuration. A single structured grid system is constructed using analytical transformations such as conformal mapping, shearing/twisting/rotating/clustering/stretching transformations. The Reynolds-averaged, thin-layer Navier-Stokes equations are solved on a supercomputer, FACOM VP-400, using the LU-ADI factorization method. Author

CALCULATIONS OF UNSTEADY AERODYNAMICS FOR A FULL AIRCRAFT CONFIGURATION USING BOUNDARY ELEMENT METHOD

MITSUNORI YANAGIZAWA, YOSHIYUKI MORITA, and SHIGEFUMI TATSUMI (Mitsubishi Heavy-Industries Ltd., Nagoya, Japan) *In its* Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 91-101 Nov. 1987 *In* JAPANESE; ENGLISH summary

Avail: NTIS HC A12/MF A01

A boundary element method is presented for determining aerodynamic loadings on arbitrary configurations in oscillatory subsonic flow. Formulas (modified Morino's method) are given for the unsteady pressure distributions or unsteady force experienced in subsonic flow by the wing-store combination, oscillating in the torsional oscillations about a fixed axis parallel to the span and other oscillating modes (flapping, plunging). Interference effects from an underwing pylon store were analyzed. The method is finally verified through comparison with experiment for the model at angles of attack from -5 to +5 degrees, and reduced frequencies from 0.65 to 1.3 at low subsonic flow. Author

GRID GENERATION OF A HELICOPTER ROTARY-WING

ALAIN CARCASSES and Y. YOSHIZAWA *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 247-253 Nov. 1987 *In* JAPANESE; ENGLISH summary

Avail: NTIS HC A12/MF A01

A method of an elliptic grid generation for a helicopter rotary-wing is proposed. The main purpose of this work is flexibility

02 AERODYNAMICS

for expected several flight conditions of helicopters. The elliptic grid generation is reduced to the method of solution of a large scale simultaneous equations. Three-dimensional grid points are rearranged into one-dimensional vectors, of which components are all the grid points in a surface of generated curvilinear coordinates. The SOR method is applied to the one-dimensional vectors in a checker board manner, and the conjugate gradient method is used to solve each equation. In the range of test calculation the proposed method is satisfactory from the viewpoints of numerical calculations. More efficiency, however, would be required for the grid generation in a larger scale of calculation.

ON THE DYNAMIC BEHAVIOR OF BALLOON DURING ITS LAUNCH; APPLICATION OF PANEL METHOD AND EXTENSION TO UNSTEADY PROBLEM

YOSHIFUMI INATANI Jul. 1987 25 p

(ISAS-RN-622; ISSN-0285-6808) Avail: NTIS HC A03/MF A01

The boundary integral method (Panel method) has been applied and extended to investigate the unsteady problem in which body shape is deformed dynamically due to flow effects inside or outside the body. Such an unsteady effect has been represented by use of an extension of the conventional panel method. The interaction between the deformation of the body and the flow field is represented as a Virtual Mass Matrix, and the motion of the body surface and the flow field are solved by tracing the control points distributed on the body surface. Integral relations of the singularity distributed on the panel are also presented. Techniques developed are applied to the dynamic simulation of a balloon launching. A series of simulation studies was carried out and the deformation of the balloon during its launch has been followed. The dynamic behavior of the balloon during launching and the load history of the balloon membrane are obtained.

WALL INTERFERENCE ASSESSMENT/CORRECTION OF DATA FROM TESTS OF A CAST 10-2/DOA 2 AIRFOIL IN THE LANGLEY 0.3-M TRANSONIC CRYOGENIC TUNNEL M.S. Thesis

CLYDE R. GUMBERT May 1988 68 p

Avail: NTIS HC A04/MF A01

A Wall Interference Assessment/Correction (WIAC) procedure developed for the 8- by 24-inch slotted wall airfoil test section of the Langley 0.3-m Transonic Cryogenic Tunnel was applied to data from three tests of the CAST 10-2/DOA 2 airfoil. The uncorrected data from these tests contained dissimilarities attributable to different model sizes and differences in test section conditions. It is shown that the upstream flow angle required as a boundary condition in the WIAC code can be deduced from the first pass through the correction code by considering the front of the model to be a flow angle probe. It is also shown that a model aspect ratio factor such as that proposed by Murthy is required to more properly account for the sidewall boundary layer contribution to the blockage interference and hence the Mach number correction. The resulting angle of attack and Mach number corrections make data from the three tests collapse over most of the range of Mach number and Reynolds number where the tests overlap.

The development of two and three dimensional Euler correction methods based on the Clebsch transformation is described. In these methods, the velocity field is decomposed into irrotational and rotational parts. A multi-grid full potential method based on both the finite difference and finite volume formulations is modified to solve for the rotational part. Two approaches are developed to solve for the rotational field. The approximate Euler-Clebsch approach assumes the entropy is convected along mesh lines, while the exact Euler-Clebsch approach solves the convection of entropy numerically along streamlines. The two approaches agree well in the airfoil application. Only the approximate Euler-Clebsch approach is employed in the three dimensional calculations. A study of finite difference and finite volume formulations of the full potential equation is also included. Solutions are presented for various airfoils, wings and an F-14 wing/body and are compared with results of the full potential and the time marching Euler methods.

NUMERICAL STUDY OF DELTA WING LEADING EDGE BLOWING

DAVID YEH, DOMINGO TAVELLA, and LEONARD ROBERTS Jul. 1988 130 p

(Contract NCC2-341)

(NASA-CR-183101; NAS 1.26:183101; JIAA-TR-86) Avail: NTIS HC A07/MF A01 CSCL 01A

Spanwise and tangential leading edge blowing as a means of controlling the position and strength of the leading edge vortices are studied by numerical solution of the three-dimensional Navier-Stokes equations. The leading edge jet is simulated by defining a permeable boundary, corresponding to the jet slot, where suitable boundary conditions are implemented. Numerical results are shown to compare favorably with experimental measurements. It is found that the use of spanwise leading edge blowing at moderate angle of attack magnifies the size and strength of the leading edge vortices, and moves the vortex cores outboard and upward. The increase in lift primarily comes from the greater nonlinear vortex lift. However, spanwise blowing causes earlier vortex breakdown, thus decreasing the stall angle. The effects of tangential blowing at low to moderate angles of attack tend to reduce the pressure peaks associated with leading edge vortices and to increase the suction peak around the leading edge, so that the integrated value of the surface pressure remains about the same. Tangential leading edge blowing in post-stall conditions is shown to re-establish vortical flow and delay vortex bursting, thus increasing C sub L sub max and stall angle.

AIR TRANSPORTATION AND SAFETY

The manifold peculiarities of the laws of air resistance are able to support entirely satisfactorily the aerodynamic theory of air resistance explained here. The shape of the rear portion of the body is in many instances more important for resistance than the shape of the front section. By means of appropriate design, the resistance of aircraft bodies and similar vehicles can be reduced to close to theoretical value zero. Author

CALCULATION OF 2-D UNSTEADY TRANSONIC FULL POTENTIAL FLOW ABOUT OSCILLATING AIRFOILS BY TWO COMPLEMENTARY APPROACHES

H. SCHIPPERS and M. H. L. HOUNJET 1986 16 p Presented at the 4th AIAA Applied Aerodynamics Conference, 9-11 Jun. 1986, San Diego, Calif. Previously announced in IAA as A86-49586 Sponsored by Nederlands Inst. voor Vliegtuigontwikkeling en Ruimtevaart, Delft (PB88-127519; NLR-MP-86035-U) Avail: NTIS HC E03/MF E01; copy not available from STI Facility CSCL 01A

Results of 2-D unsteady transonic flow calculations for AGARD standard aeroelastic configurations are presented, which were obtained by numerical methods for the solution of the unsteady full potential equation. Two complementary methods were applied to oscillating transonic flow about thick blunt-nosed airfoils: (1) the time-integration TULIPS method; and (2) the time-linearized FIRANC method. The calculations were performed for the subsonic and transonic flow about the supercritical NLR 7301 airfoil, both undergoing sinusoidal pitching oscillations. The results of both methods are extensively compared. GRA

THE DETERMINATION OF THE TOPOLOGICAL STRUCTURE OF SKIN FRICTION LINES ON A RECTANGULAR WING-BODY COMBINATION

LESLIE A. YATES and RICHARD L. FEARN Aug. 1988 13 p (Contract NAG1-368) (NASA-CR-4168; NAS 1.26:4168) Avail: NTIS HC A03/MF A01 CSCL 01A

A short tutorial in the application of topological ideas to the interpretation of oil flow patterns is presented. Topological concepts such as critical points, phase portraits, topological stability, and indexing are discussed. These concepts are used in an ordered procedure to construct phase portraits of skin friction lines with oil flow patterns for a wing-body combination and two angles of attack. The relationship between the skin friction phase portrait and planar cuts of the velocity field is also discussed. Author

THE CERTIFICATION ASPECTS OF MICROWAVE LANDING SYSTEMS - AIRWORTHINESS CONSIDERATIONS

SIMON A. WITTS (Civil Aviation Authority, Design and Manufacturing Standards Div., Redhill, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 16-25.

An outline is presented of the certification requirements that could be applied for an MLS. The importance of a research program such as the joint Boeing/British Airways/Civil Aviation Authority trial is demonstrated. The trial seeks to establish and incorporate certification requirements for straight-in 3-deg MLS approaches. K.K.

A88-46508

APPLICATION OF TEAM CONCEPT/SYSTEMS APPROACH TO INVESTIGATION OF MAJOR MISHAPS

RUDOLF KAPUSTIN (Intercontinental Aviation Safety Consultants, Baltimore, MD) IN: Information systems: Failure analysis; Proceedings of the NATO Advanced Research Workshop, Bad Windsheim, Federal Republic of Germany, Aug. 18-22, 1986. Berlin and New York, Springer-Verlag, 1987, p. 59-65. refs

The application of the team concept/systems approach (TCSA) is illustrated by a case history involving the PSA/Cessna midair collision over San Diego on September 25, 1978. It is suggested that the TCSA can be applied to the investigation of any catastrophic or noncatastrophic event or system failure. The nucleus of the investigation team and a comprehensive investigation plan must be in place and in a state of readiness at all times, and may be specifically tailored to the system that may be subject to failure and subsequent investigation. A paragraph relating to accident investigation is recommended for inclusion in a future NATO document. B.J.

A88-46511* Miami Univ., Coral Gables, Fla.

FALLIBLE HUMANS AND VULNERABLE SYSTEMS - LESSONS LEARNED FROM AVIATION

EARL L. WIENER (Miami, University, Coral Gables, FL) IN: Information systems: Failure analysis; Proceedings of the NATO Advanced Research Workshop, Bad Windsheim, Federal Republic of Germany, Aug. 18-22, 1986. Berlin and New York, Springer-Verlag, 1987, p. 163-181. refs (Contract NCC2-377)

It is suggested that the problems being experienced in complex automatic systems are essentially due to the failure of information management and communication. The failure covers the entire spectrum: display devices and techniques, coding information so as to reduce human error, and information economy, i.e., resisting the temptation to bombard the operator with unlimited information

03 AIR TRANSPORTATION AND SAFETY

simply because the system possesses the capability to do so. Since there has been great progress in hardware engineering, it is suggested that further attention is needed in the 'soft' side of systems. The approach should focus on (1) preventing human cognitive slips and (2) making the systems less vulnerable to such slips when they do occur. Most of the examples are taken from studies of cockpit automation. B.J.

A88-46973

AIRPORT LOAD LEVELING BY ACTIVITY ANALYSIS

JAMES L. DUDA (Transportation Systems Center, Cambridge, MA) and CHARLES I. BARTFELD (American University, Washington, DC) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 521-524.

A simulation model can be used to develop and analyze alternative policies for relieving airport saturation and associated travel delays, or for postponing the onset of airport saturation. An airport capacity and delay model is described as well as the data required, methodology, and assumptions. Short term, long term, physical, and nonphysical means can be identified and examined by means of simulation models of varying complexity. Author

AIRCRAFT JOLTS FROM LIGHTNING BOLTS

FELIX L. PITTS, BRUCE D. FISHER (NASA, Langley Research Center, Hampton, VA), VLADISLAV MAZUR (NOAA, National Severe Storms Laboratory, Norman OK), and RODNEY A. PERALA (Electro Magnetic Applications, Inc., Denver, CO) IEEE Spectrum (ISSN 0018-9235), vol. 25, July 1988, p. 34-38.

The trend toward the use of composite materials and digital electronics has renewed the need to quantify the effects of lightning strikes to airplanes, since composite structures do not provide shielding equivalent to that of metal aircraft, and digital systems are potentially more susceptible to upset by electrical transients than are analog electronic systems. A research program, called the Storm Hazards Program, has been run by the National Aeronautics and Space Administration (NASA) for the past eight years and has provided the first statistically significant measurements of the electromagnetic interaction between lightning and aircraft. A NASA-owned F-106B airplane has been flown through thunderstorms about 1500 times at altitudes between 5,000 and 40,000 feet (1,500 to 12,000 meters). The airplane, lightning-hardened and outfitted with special instruments, was hit by lightning 714 times. The types of measurements made and the results are described. I.E.

CURRENT FIRE SAFETY DESIGN ASPECTS OF COMMUTER

AIRCRAFT Final Report

RICHARD CLARKE, DEBORAH KANE, and CARLA STEWART
Mar. 1988 85 p

(Contract DTFA03-86-C-00062)

(DOT/FAA/CT-87/32) Avail: NTIS HC A05/MF A01

Fire safety systems, cabin design and materials in cabin areas of ten common commuter aircraft are described. The trend in these commuter aircraft is increasing sophistication in application of materials similar to those in large commercial aircraft. Among the ten aircraft two are older, piston powered aircraft, simple in design and materials applications. Of the other larger eight aircraft, two are no longer delivered. Four newer and larger designs feature large, separate baggage compartments. Only two aircraft have overhead storage bins. One aircraft has a large interior with standing headroom. The others are much more compact, with interior storage limited to bins at the entry point. Thermoplastics and composite materials are used in the newer aircraft. Each aircraft originally was equipped with polyurethane cushions; currently, operators and manufacturers are protecting cushions with fire blocking materials. Piston powered aircraft use gasoline cabin heaters and ram cooling airflow. The other eight aircraft are turboprop using engine bleed air for cabin heating and cooling. Six aircraft are unpressurized and four are pressurized. Author

AIRCRAFT ACCIDENT REPORT: NORTHWEST AIRLINES, INC., MCDONNELL DOUGLAS DC-9-82, N312RC, DETROIT METROPOLITAN WAYNE COUNTY AIRPORT, ROMULUS, MICHIGAN, AUGUST 16, 1987

10 May 1988 143 p

(PB88-910406; NTSB/AAR-88/05) Avail: NTIS HC A07/MF A01 CSCL 01C

At 2046 EDT on 16 August 1987, Northwest Airlines, Inc., flight 255 crashed shortly after taking off from runway 3 center at the Detroit Wayne County Airport, Romulus, Michigan. Flight 255, a McDonnell Douglas DC-9-82, U.S. Registry N312RC, was a regularly scheduled passenger flight and was en route to Phoenix, Arizona. According to witnesses, flight 255 began its takeoff rotation about 1,200 to 1,500 feet from the end of the runway and lifted off near the end of the runway. After liftoff, the wings of the airplane rolled to the left and the right about 35 deg in each direction. The plane collided with the obstacles northeast of the runway when the left wing struck a light pole located 2,760 feet beyond the end of the runway. Thereafter the plane struck other light poles, the roof of a car rental facility, and then the ground. It continued to slide along a path aligned generally with the extended centerline of the takeoff runway. The airplane broke up as it slid across the ground and postimpact fires erupted along the wreckage path. Aboard Flight 255, 148 passengers and 6 crewmembers were killed; 1 passenger, a 4-year-old was seriously injured but survived. On the ground, two persons were killed, one seriously injured, and four suffered minor injuries. The National Transportation Safety Board determines that the probable cause of the accident was the flightcrew's failure to use the taxi checklist to ensure that the flaps and slats were extended for takeoff. Contributing to the accident was the absence of electrical power to the airplane takeoff warning system which thus did not warn the flightcrew that the airplane was not configured properly for takeoff. The reason for the absence of electrical power could not be determined. Author

AIRCRAFT ACCIDENT REPORT: AIR NEW ORLEANS, DBA CONTINENTAL EXPRESS FLIGHT 962 BRITISH AEROSPACE 3101 (JETSTREAM 31), N331CY, NEW ORLEANS INTERNATIONAL AIRPORT, KENNER, LOUISIANA, MAY 26, 1987

31 May 1988 63 p

(PB88-910408; NTSB/AAR-88/06) Avail: NTIS HC A04/MF A01 CSCL 01C

On 26 May 1987, at 1645 central daylight time, Air New Orleans, doing business as Continental Express flight 962, departed runway 19 at New Orleans International Airport on a scheduled commuter flight to Eglin AFB, Fla. There were two pilots and nine passengers. As the airplane reached an altitude between 150 and 200 feet, the crew felt a severe yawing motion and observed the engine torque fluctuate erratically. The captain proceeded to make an emergency landing in the departure overrun of runway 19. Follow one bounce and final touchdown, maximum braking and full reverse thrust were applied. The airplane then rolled off the overrun, across an airport access road, through an airport security fence, through a concrete highway barrier, and across a highway. The airplane struck several vehicles on the roadway during the accident sequence. Two passengers suffered serious injuries. In addition, both pilots, seven passengers, and two occupants of ground vehicles received minor injuries. The airplane was destroyed. Author

INFLUENCE OF WIND SHEAR ON THE AERODYNAMIC CHARACTERISTICS OF AIRPLANES

DAN D. VICROY Aug. 1988 62 p Sponsored by NASA, Washington, D.C. and DOT, Washington, D.C.

(NASA-TP-2827; L-16439; NAS 1.60:2827; DOT/FAA/PS-88/15) Avail: NTIS HC A04/MF A01 CSCL 01C

The aerodynamic effect of shear flow through a series of sensitivity studies of the wind velocity gradients and wing planform geometry parameters is investigated and characterized. The wind shear effect is computed using a modified vortex-lattice computer program and characterized through the formulation of wind shear aerodynamic coefficients. The magnitudes of the aerodynamic effects are demonstrated by computation of the resultant change in the aerodynamics of a conventional wing and horizontal stability configuration on a fixed flight path through a simulated microburst. The results indicate that as much as 20 percent of the control authority of the airplane may be required to counteract the wind-shear-induced forces and moments in the microburst environment. Author

AIRCRAFT ACCIDENT REPORT: JOE FOSTER EXCAVATING, INC., BELL 206B, N49606, IN-FLIGHT COLLISION WITH TREES, ALAMO, CALIFORNIA, AUGUST 3, 1986

2 May 1988 27 p
(PB88-910405; NTSB-AAR-88-04) Avail: NTIS HC A03/MF A01 CSCL 01C

On August 3, 1986, at 1235 Pacific daylight saving time, a Bell 206B helicopter, N49606, owned and operated by Joe Foster Excavating, Inc., Danville, California, crashed in a wooded area in Alamo, California, while circling a residence. Visual meteorological conditions prevailed at the time. The pilot and passenger, the owner of the helicopter, sustained fatal injuries; the helicopter was destroyed. The National Transportation Safety Board determines that the probable cause of this accident was the pilot's incapacitation resulting from a myocardial event. Contributing to the cause of the accident was the pilot's failure to comply with the provisions of both his medical and pilot certificates and the inadequate procedures used by the Federal Air Surgeon to medically recertify the pilot. Author

AIRCRAFT ACCIDENT REPORT: MIDAIR COLLISION OF SKYWEST AIRLINES SWEARINGEN METRO 2, N163SW, AND MOONEY M20, N6485U, KEARNS, UTAH, JANUARY 15, 1987

15 Mar. 1988 71 p
(PB88-910404; NTSB-AAR-88-03) Avail: NTIS HC A04/MF A01 CSCL 01C

On January 15, 1987, at about 1252 mountain standard time, SkyWest flight 1834, a Swearingen SA-226TC (METRO 2), and a Mooney M20 collided in flight over Kearns, Utah, in visual meteorological conditions. The two pilots and six passengers aboard the METRO 2 and the two pilots aboard the Mooney were killed in the accident which occurred within the confines of the Salt Lake City airport radar service area. The National Transportation Safety Board determines that the probable cause of this accident was lack of navigational vigilance by the Mooney instructor pilot which led to the unauthorized intrusion into the Salt Lake City airport radar service area. Contributing to the accident were the absence of a mode-C transponder on the Mooney airplane and the limitations of the air traffic control system to provide collision protection under the circumstances of this accident. (Contract NAG1-834)
(NASA-CR-183060; NAS 1.26:183060; PR-150-6549-1) Avail: NTIS HC A06/MF A01 CSCL 01C

The principal objective is to develop methods for assessing the likelihood of wind shear encounter, for deciding what flight path to pursue, and for using the aircraft's full potential for combating wind shear. This study requires the definition of both deterministic and statistical techniques for fusing internal and

external information, for making go/no-go decisions, and for generating commands to the aircraft's cockpit displays and autopilot for both manually controlled and automatic flight. The program has begun with the development of a real-time expert system for pilot aiding that is based on the results of the FAA Windshear Training Aids Program. A two-volume manual that presents an overview, pilot guide, training program, and substantiating data provides guidelines for this initial development. The Expert System to Avoid Wind Shear (ESAWS) currently contains over 140 rules and is coded in the LISP programming language for implementation on a Symbolics 3670 LISP machine. Author

ENHANCED EMERGENCY SMOKE VENTING Final Report

ELLIOTT L. MAYLOR Jul. 1988 96 p
(Contract DTFA03-87-C-00038)
(DOT/FAA/CT-88/22) Avail: NTIS HC A05/MF A01

This study evaluated two concepts modifying the air conditioning systems of large commercial airplanes to enhance the venting of smoke that may be continuously injected into the passenger cabin during inflight fire emergencies. Data from past fire accidents and airplane tests provided a basis for creating four fire/smoke scenarios and deriving five sets of equations to predict the smoke venting effectiveness of current airplanes and the proposed concepts. Concept A would modify the air conditioning packs by adding high flow modes with dual outflow valves and Concept B would add ram air ventilation with an added dump valve. The estimated costs to incorporate Concept A or B in the U.S. fleet were about 381 or 587 million dollars, respectively. The effectiveness equations predicted that both concepts would provide only slightly significant smoke venting enhancement. Furthermore, the study showed that both concepts would have been negated by reported crew actions and/or fire damage in past fires. It was concluded that current U.S. fleet airplanes will keep a majority of the passenger cabin free of smoke during inflight fires while the air conditioning systems are kept operating. Author

MLS - AN OPERATIONAL AND TECHNICAL REVIEW; PROCEEDINGS OF THE SYMPOSIUM, LONDON, ENGLAND, FEB. 9, 1988

Symposium sponsored by the Royal Aeronautical Society, London, Royal Aeronautical Society, 1988, 80 p. For individual items see A88-46252 to A88-46259.

The conference presents papers on MLS development and UK requirements, the certification aspects of microwave landing systems, UK MLS operational trails, and the FAA viewpoint on MLS operational benefits. Other topics include RAF plans for MLS, an industry view of the future of MLS, and the opinion of an international airline. Consideration is also given to the UK regional airline point of view. K.K.

A88-46252

MLS DEVELOPMENT AND UK REQUIREMENTS

J. L. LAWSON (Civil Aviation Authority, London, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 1-15.

The program developed by the UK Civil Aviation Authority to meet the international transition requirements of MLS is described. The program strives to produce an equipment specification to meet an MLS proving phase and subsequent UK procurement program

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION

before the peak worldwide demand arises. The environment is discussed as well as the ground system, ground and flight inspection, and operational data. K.K.

A88-46254

UK MLS OPERATIONAL TRIALS

B. TREMAIN (British Airways, PLC, Hounslow, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 26-41.

The participation by British Airways in the UK operational trials program at Heathrow is described. Particular attention is given to a Boeing 757 which was equipped with three MLS receivers and an additional flight data recording system for the purpose of these trials. It is noted that the MLS installation already has many of the features that will be required for MLS automatic landings. K.K.

A88-46255

MLS: OPERATIONAL BENEFITS - THE FAA VIEWPOINT

J. M. DEL BALZO (FAA, Washington, DC) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 42-50.

The reasons for aircraft delays at the major airports are outlined and initiatives being pursued by the FAA and the airline industry to reduce delays are outlined. It is believed that MLS will dramatically improve airport capacity. It can make better use of terminal airspace, provide independent arrival and departure streams at major airports, reduce airspace conflicts, and minimize noise impacts near airports. K.K.

A88-46256

RAF PLANS FOR MLS

K. G. BENNETT (Ministry of Defence /Air/, Directorate of Signals, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 51-56.

The reasons for NATO's decision to replace PAR with the time-referenced scanning beam MLS at all its main bases are outlined. From a military point of view, offset or curved approaches will increase runway utilization. Thus, recovering aircraft will be able to avoid nearby missile engagement zones. The system only needs to radiate when an aircraft is on the approach; it can be triggered from the air. The plans for MLS in the RAF are discussed in detail. K.K.

A88-46257

AN INDUSTRY VIEW OF THE FUTURE OF MLS

P. J. TAYLOR (Plessey Radar Systems, Ltd., Cowes, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 57-62.

A general industry view of the future of MLS is given on the basis of comparison between MLS and ILS. MLS offers many technical advantages, including smaller transmitter systems that are easier and cheaper to install, and more accurate guidance information. In a discussion of a manufacturer's view of the MLS market, consideration is given to operational requirement and user need, market size, market timescales, competition, and threats. K.K.

A88-46258

AN INTERNATIONAL AIRLINE'S OPINION

J. TEEUW (KLM Royal Dutch Airlines, Schiphol, Netherlands) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 63-70.

It is believed that the replacement of ILS with MLS as a standard ICAO approach system can only be justified if it is needed to solve the limitations of ILS for the straight-in approach. It is maintained that this replacement means a great investment for

the States and the airlines. In the transition from ILS to MLS, consideration should be given to the airlines' low visibility operation. K.K.

A88-46259

THE UK REGIONAL AIRLINE VIEW

D. HENRY (Air UK Leisure, England) IN: MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988. London, Royal Aeronautical Society, 1988, p. 71-74.

The advantages and disadvantages of the MLS program are outlined. While MLS does provide frequency protection, it is maintained that, for the regional operator, the cost of MLS is too high to justify its use when ILS has itself advanced considerably. The operational impact of the change is considered with emphasis placed on the interim period when both ILS and MLS will be operational, and then the long-term use of MLS only. K.K.

A88-46263

SOME ASPECTS OF AUTOMATIC SPEECH RECOGNITION UNDER HELICOPTER VIBRATION

G. M. ROOD and C. LEEKS (Royal Aircraft Establishment, Human Engineering Div., Farnborough, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 31-49. refs

Attention is given to the problem of helicopter vibration-induced performance degradation in cockpit direct voice input (DVI) control systems. The problem is especially acute at the two resonant frequencies of the larynx. Data have been obtained for DVI of single digits and triple digits; the latter is understandably the more severely affected by the 20-Hz vertical vibration condition. Speech recognition is also substantially affected and calls for additional helicopter noise-reduction efforts. O.C.

A88-46512

ERROR AUDITING IN AIR TRAFFIC CONTROL

JACOB EMPSON (Hull, University, England) IN: Information systems: Failure analysis; Proceedings of the NATO Advanced Research Workshop, Bad Windsheim, Federal Republic of Germany, Aug. 18-22, 1986. Berlin and New York, Springer-Verlag, 1987, p. 191-198. refs

Langan-Fox and Empson (1985) applied the technique of error auditing in the setting of ATC. This paper summarizes their results and evaluates the implications for improving safety in ATC in the contexts of training, maintenance of standards, and the improvement of the working environment. Central to the error-auditing approach is the notion that errors are not merely accidental but are seen as the consequence of poor planning or the inadequate execution of reasonable plans. B.J.

A88-46521

PROJECT ROSAR - A HIGH-RESOLUTION, ALL-WEATHER VISIBILITY METHOD FOR HELICOPTERS [PROJEKT ROSAR - EIN HOCHAUFFLOESENDES ALLWETTERSICHTVERFAHREN FUER HUBSCHRAUBER]

HELMUT KLAUSING, WOLFGANG KEYDEL (DFVLR, Institut fuer Hochfrequenztechnik, Oberpfaffenhofen, Federal Republic of Germany), and HORST KALTSCHMIDT (Messerschmitt-Boelkow-Blohm GmbH, Ottobrunn, Federal Republic of Germany) DFVLR-Nachrichten (ISSN 0011-4901), June 1988, p. 29-32. In German.

The development of a rescue method using helicopters with an all-weather visibility system aboard is discussed. The use of an expanded antenna aperture and of synthetic aperture radar (SAR) as solutions to the visibility problem is addressed. The concept of a rotating SAR, or ROSAR, for all-weather visibility is described. C.D.

A88-47194

BEACON NAVIGATION

A. C. FRY (British Aerospace, PLC, London, England) IN: Remotely

piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Conference Papers. Bristol, England, University of Bristol, 1987, p. 21.1-21.4.

The present beacon navigation system for RPVs employs a ground-emplaced beacon that remains quiescent until interrogated in a code that is unique to that specific beacon. Prior to launch, the RPV's memory would be loaded with various instructions; the approximate positions of all beacon emitters previously dropped onto the area of interest would be known, together with their individual codes. The interrogation technique can be used to progress from one beacon to another, using them as way-points to provide midcourse guidance to the area of interest. O.C.

N88-26353# Eurocontrol Experimental Centre, Bretigny (France).

STATISTICAL PROPERTIES OF REAL TIME EVENTS IN AN ATC (AIR TRAFFIC CONTROL) SYSTEM

H. P. ENGLMEIER and P. HUNT Jun. 1987 28 p (PB88-118781; EEC-205) Avail: NTIS HC E04/MF E04; copy not available from STI Facility CSCL 17G

The analysis of the flow of data in a processing system concerning air traffic control is described. It was found that the frequency of events or interrupts when expressed as a function of the time interval between two consecutive events or interrupts follows a lognormal distribution or a superposition of several lognormal distributions. The analysis, the validity of the results, the theoretical background and possible applications for real time systems are treated. Author

DESIGN OF AIRCRAFT STRUCTURES [PROEKTIROVANIE KONSTRUKTSII SAMOLETOV]

ELENA SERGEEVNA VOIT, ASKOL'D IVANOVICH ENDOGUR, ZAVEN ASHOTOVICH MELIK-SARKISIAN, and IGOR' MIKHAILOVICH ALIAVDIN Moscow, Izdatel'stvo Mashinostroenie, 1987, 416 p. In Russian. refs

This work elaborates the principles underlying the design of aircraft structural components (wings, fuselages, tail assemblies, etc.) and considers methods for assuring structural stability with minimum weight. Algorithms for the design of junctions between components are examined, and requirements on the total structural design of an aircraft are presented along with criteria for the optimization of design solutions. The role of fabrication processes and the materials used in the choice of design is considered. B.J.

A88-46212
DESIGN CONSIDERATIONS FOR THE AVOIDANCE OF G-LOC

C. HANSFORD (British Aerospace, PLC, London, England) IN: High G and high G protection - Aeromedical and operational aspects; Proceedings of the Symposium, London, England, Oct. 21, 1987. London, Royal Aeronautical Society, 1987, p. 78-88.

A speculative treatment is presented for high pilot reclination cockpit configurations aimed at minimizing the effects of high +G(z) on pilot performance. These high-reclination seating arrangements pose fundamental questions of canopy visibility, instrument visibility, and ejection seat type and trajectory. In the future, the threat posed by pilot-blinding laser weapons may substantially alter the role of external visibility in pilot seating geometries. A totally supine pilot position yields near-ideal G tolerance in both normal flight and cockpit-capsule ejection. O.C.

A88-46242
FLIGHT-TEST OF TURBULENT SKIN-FRICTION REDUCTION BY RIBLETS

J. DOUGLAS MCLEAN, DEZSO N. GEORGE-FALVY, and PETER P. SULLIVAN (Boeing Commercial Airplane Co., Seattle, WA) IN: Turbulent drag reduction by passive means; Proceedings of the International Conference, London, England, Sept. 15-17, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 408-424. refs

Plastic riblet film developed by the 3M Company was flight tested on the upper surface of the wing of a T-33 airplane. Increments in the average skin friction of the riblet surface relative to a smooth surface were determined by rakes of pitot tubes at 83 percent chord. For optimum combinations of groove spacing and Reynolds number, average skin-friction reductions of about 6 percent were observed. The local scaling relationship implied by earlier NASA data was found to apply in an average sense over the length of the test surface, and the riblets were found to remain effective in the adverse pressure gradient on the aft portion of the wing. Finite-difference calculations of the boundary-layer development, with a modification to the eddy viscosity to account for the riblet effect, were found to be helpful in interpreting the data. A88-46260
HELICOPTER VIBRATION AND ITS REDUCTION; PROCEEDINGS OF THE SYMPOSIUM, LONDON, ENGLAND, NOV. 16, 1987

Symposium sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1987, 154 p. For individual items see A88-46261 to A88-46270.

The present conference discusses the origin of helicopter vibration and its control methods, the physiological effects of helicopter vibration, effective automatic speech recognition methods in a helicopter vibration environment, and the assessment of helicopter vibration exposure in operators. Also discussed are civil helicopter operations; helicopter vibration control in the UK's fleet air arm; efficient rotor track and balance diagnostics; RAF vibration control methods; UK Army experience with the Lynx helicopter's head absorber; and helicopter vibration minimization through blade design, higher harmonic pitch, and active structural resonance control methods. O.C.

A88-46261
HELICOPTER VIBRATION - ITS ORIGIN AND METHODS OF CONTROL

D. E. H. BALMFORD (Westland Helicopters, Ltd., Yeovil, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 1-19. refs

Of the various methods available for the control of helicopter vibration, the most important are the minimization of rotor-generated loads, attention to fuselage design, and in-service diagnostic and remedial procedures. Emphasis is presently placed on the control of rotor loads, since while compensatory structural modifications of the fuselage are possible at the development stage, rotor system redesign is virtually impossible. Reliable mathematical models for rotor load control are noted to be essential. O.C.

A88-46265
CIVIL OPERATIONS

K. KNIGHT (Bristow Helicopters, Ltd., Redhill, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 70-85.

The aim of a Health and Usage Monitoring system is to supplant subjective pilot reports as to helicopter vibration levels in civil operations, thereby obviating engineering data gathering on routine flights. By pinpointing the most likely maintenance requirements of the rotor systems in question, engineering effort will be reduced, aircraft availability will be improved, and operating costs will be lowered. O.C.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

A88-46266

HELICOPTER VIBRATION CONTROL IN THE FLEET AIR ARM

P. J. LEGGE (Ministry of Defence, London, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 86-92.

The structured vibration-control organization based on Vibration Control Cells at UK Royal Navy Fleet Air Arm stations has proven capable of obtaining significant reductions in in-service vibration levels for Sea King helicopters. The 1R and 5R main rotor vibration levels now average between 50 and 75 percent of specified thresholds. In addition, the compilation of data bases for each type of vibration, relating maintenance actions to vibration levels, is improving understanding of vibration problems. O.C.

A88-46268

VIBRATION CONTROL AT RAF ODIHAM

A. M. VERDON (Ministry of Defence, London, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 98-106.

The RAF has resorted to Rotor Track and Balance (RTB) advanced equipment and techniques to address serious rotor-generated vibration problems with the Chinook helicopter. One such RTB method developed for the Chinook has involved the balancing of the main-rotor head assemblies on the aircraft at 100 percent rotor rpm, with the blades removed; increasing numbers of blades have been exhibiting chordwise mass imbalance. The various RTB techniques have proven to be applicable to Puma, Sea King, and Wessex helicopters as well. O.C.

A88-46269

ARMY EXPERIENCE WITH LYNX HEAD ABSORBER

M. R. NEWBY (Ministry of Defence, Logistic Executive /Army/, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 107-115.

The UK Army's Lynx helicopter, designed for high speed and agility, experiences high inherent levels of 4R main rotor vibration; attention has consequently been given to the use of a rotor head vibration absorber that employs the structural deformation of beams as a spring mechanism. The absorber operates in the rotor disk plane and is tuned to the main rotor blade passing frequency. An optimum tuning method has been developed, whereby the absorber is tuned to the lowest overall vibration level. O.C.

A88-46270

BLADE DESIGN, HIGHER HARMONIC PITCH AND ACTIVE STRUCTURAL RESPONSE CONTROL FOR HELICOPTER VIBRATION MINIMISATION

S. P. KING and P. T. W. JUGGINS (Westland Helicopters, Ltd., Yeovil, England) IN: Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987. London, Royal Aeronautical Society, 1987, p. 116-151.

Attention is given to the problem of helicopter main-rotor-blade passing-frequency vibrations, which are equal to the product of the number of blades and the rotor speed. Unlike the 1R vibration, which can be controlled by careful rotor track and balance, the blade passing-frequency vibration is inherent in the rotor's aerodynamics. A mathematical model is formulated to analyze blade response, in the space and time domains, in terms of modal and harmonic coordinates. O.C.

A88-46311

MODERN COMBAT AIRCRAFT DESIGN

KLAUS HUENECKE Annapolis, MD, Naval Institute Press, 1987, 253 p. Translation. refs

Recent advances in the design of combat aircraft are traced in extensive photographs, drawings, and tables of numerical data and discussed. Topics addressed include the combat and handling capabilities required of modern aircraft, the phases of the aircraft design process, aerodynamics, stability and control, and engines. Particular attention is given to air-intake design, problems in the

design of aircraft tails, performance parameters, armament, avionics, cockpit instrumentation, CCV designs, and new materials. T.K.

A88-46324#

THE USE OF CFD IN HELICOPTER AERODYNAMIC DESIGN

PATRICK H. WHYTE (Bell Helicopter Textron, Fort Worth, TX) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 34, June 1988, p. 92-101. refs

The present discussion of CFD techniques' application in helicopter aerodynamic design gives attention to the design and analysis of main rotor blade airfoils, comparing pertinent experimental data with the analytical results obtained, and discussing the generation of semiempirical airfoil data tables; these tables play a central role in the prediction of hover and forward flight performance. An evaluation of current CFD limitations in these applications is followed by projections of future helicopter aerodynamics CFD methods' performance. O.C.

A88-46439

IMPACT OF ELECTRICAL FLIGHT CONTROL SYSTEMS ON A320 FLIGHT SIMULATOR DATA ACQUISITION

E. CHATRENET, M. LEIBER, and N. WARNER (Airbus Industrie, Blagnac, France) IN: The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 282-316.

The paper examines how the electrical flight control system (EFCS) of the A320 will improve the quality of the data and enhance the overall fidelity of simulation. It is shown that the global accuracy mainly relies on control-law modeling. It is concluded that the EFCS technology provides for a unique opportunity to feed analytical inputs to aircraft control surfaces which can easily be duplicated in the simulators, and permits an automatic identification program to be implemented by the aircraft manufacturer, which improves the overall accuracy of the aerodynamic model. B.J.

A88-47183

REMOTELY PILOTED VEHICLES; PROCEEDINGS OF THE SIXTH INTERNATIONAL CONFERENCE, BRISTOL, ENGLAND, APR. 6-8, 1987, CONFERENCE PAPERS AND SUPPLEMENTARY PAPERS

Conference sponsored by the Royal Aeronautical Society and University of Bristol. Bristol, England, University of Bristol, 1987, p. Conference Papers, 135 p.; Supplementary Papers, 75 p. For individual items see A88-47184 to A88-47200.

The present conference on RPV systems and component technologies discusses topics in RPV operational philosophy, navigation and guidance techniques, and relationships among imaging systems, data-links, and ground stations. Attention is given to NATO RPV-development initiatives, an operational evaluation of military RPVs, a highly maneuverable unmanned aircraft, the Seafly 200 sea-skimming target for close-in weapon simulation, the BMAD/NPT 171 propulsion system, and compact electromechanical actuators for high-performance RPV flight control. Also discussed are operational software for numerical RPV autopilot design, integrated fly-by-sensor controls for air vehicles and sensor platforms, automated route planning using knowledge-based systems, IR linescan for RPV applications, and a covert and ECM-resistant data-link for RPV airborne surveillance. O.C.

A88-47184

DESIGN AND OPERATION OF LOW COST REMOTELY-PILOTED AIRCRAFT FOR SCIENTIFIC FIELD RESEARCH

D. J. THURLING (Oxford Polytechnic, England) IN: Remotely piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Conference Papers. Bristol, England, University of Bristol, 1987, p. 5.1-5.8. refs

A development status evaluation is presented for the use of low-cost RPVs as civilian research tools, with a view to prospective technology-development and applications trends. Applications that

have been conducted to date encompass aerial photography, atmospheric monitoring, pesticide-spraying, and insect trapping. At present, low-cost systems with limited range and maneuverability are popular; RPVs with greater operating ranges and payloads are, however, becoming more widely used, and universally applicable, mass-produced commercial RPVs with interchangeable payload modules of substantial capacity are expected to emerge.
O.C.

A88-47187**UMMA - DOING IT DIFFERENTLY**

NOEL FALCONER (Eyre Enterprises, England) IN: Remotely piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Conference Papers. Bristol, England, University of Bristol, 1987, p. 9.1-9.8.

The Un-Manned Micro-Aircraft (UMMA) project is a proprietary attempt to develop an RPV for civil applications that uniquely employs an all-wing, 'Merlin' configuration in conjunction with Ni-Cd battery-powered electrical propulsion. Attention is presently given to the prospects currently emerging for improved battery-powered electrical propulsion power and efficiency, as well as to the considerable difficulties encountered in the stabilization of the UMMA's all-wing configuration. The payload for this RPV is a single camera.
O.C.

A88-47211**TESTING LARGE AIRCRAFT STRUCTURES**

R. C. SCHWARZ (Grumman Corp., Aircraft Systems Div., Bethpage, NY) IN: Dynamic failure; Proceedings of the 1987 SEM Fall Conference, Savannah, GA, Oct. 25-28, 1987. Bethel, CT, Society for Experimental Mechanics, Inc., 1987, p. 107-111.

Static and fatigue test methods for large aircraft structures of fiber-reinforced composite materials are described and illustrated with examples involving the horizontal stabilizer for the B-1 bomber. Consideration is given to the static loading tests (at temperatures up to 127 C), the design of the 138-step fatigue-test sequence to simulate mission loading, the failing-load test (which found a failure load equal to 132 percent of the ultimate design load), and the fatigue-test instrumentation. Diagrams, drawings, graphs, and photographs are provided.
T.K.

A88-47213**DAMAGE TOLERANCE OF A COMPOSITE MULTIRIB WING BOX**

RAY E. HORTON (Boeing Military Airplane Co., Seattle, WA) and EDVINS DEMUTS (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) IN: Dynamic failure; Proceedings of the 1987 SEM Fall Conference, Savannah, GA, Oct. 25-28, 1987. Bethel, CT, Society for Experimental Mechanics, Inc., 1987, p. 150-159.

The design and damage-tolerance testing of a 2.5 x 4 x 8-ft multirib CFRP wing box for a large transport aircraft are described and illustrated with extensive diagrams, drawings, graphs, and photographs. The problem of visibly undetectable impact damage is discussed; the overall design concept and FEM analysis of the wing box are outlined; and the inspection, damage-induction, and test procedures are characterized in detail. The box survived two cyclic load lifetimes and was then tested to failure, which occurred at the damaged sites at about 105 percent of the design goal.
T.K.

A88-48025#**PTA FLIGHT TEST OVERVIEW**

D. T. POLAND, H. W. BARTEL (Lockheed Aeronautical Systems Co., Marietta, GA), and P. C. BROWN (United Technologies Corp., Hamilton Standard Div., Windsor Locks, CT) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference and Exhibit, 24th, Boston, MA, July 11-13, 1988. 12 p. refs
(AIAA PAPER 88-2803)

The propfan offers on the order of 20-percent improvement in propulsive efficiency at Mach 0.7-0.85, with commensurate benefits in DOC when compared with turbofans. In August 1984, NASA-Lewis initiated a program for the design, modification, and

flight testing of a propfan propulsion system on a Gulfstream GII aircraft. Descriptions are presented of the testbed aircraft modifications, test instrumentation, and flight test program. Preliminary test results are presented for propfan structural behavior, near-field noise, and far-field noise.
Author

A88-48451**SUKHOI FLANKER**

Air International (ISSN 0306-5634), vol. 35, Aug. 1988, p. 69-76.

An account is given of the design features, observed armaments, and likely performance capabilities of the Soviet Union's Sukhoi Su-27 air defense fighter, designated 'Flanker' by NATO. The Flanker-B variant, which is the production version towards which development test program of the Flanker-A preproduction aircraft led, possesses two wingtip missile launchers for self-defense together with four underwing and four fuselage-belly pylons for longer-range interception missiles. The single-seat aircraft incorporates two new Tumansky turbofans of 0.5-1.0 bypass ratio and nearly 30,000 lbs thrust output, which in conjunction with a 50,000 lb takeoff weight (with full internal fuel load and six 'Alamo' AAMs) afford a speed of Mach 2.0 on afterburners.
O.C.

A88-48453**THE HIGH TECHNOLOGY TEST BED PROGRAM**

HUGH W. COPELAND and SANDRA K. HOFFMANN (Lockheed Aeronautical Systems Co., Marietta, GA) Lockheed Horizons (ISSN 0459-6773), May 1988, p. 36-46.

The proprietary High Technology Test Bed (HTTB) program was launched in 1984 in order to perform in-flight validation of technologies anticipated to be essential in achieving the performance requirements of future tactical transport aircraft. A stretched-fuselage commercial version of the C-130 was chosen as the technology-integration test vehicle, and fitted with a real-time performance data monitoring system composed of 1024 data channels. In order to accomplish the requisite STOL mission, many improvements have been made to the HTTB's control surfaces and flight control system. Fly-by-wire controlled composite-material spoilers on the wing upper surfaces furnish direct lift control; these, in concert with extended-chord ailerons, enhance low-speed lateral control characteristics.
O.C.

A88-48458**AVANTI- PUSHING AHEAD TO CERTIFICATION**

HARRY HOPKINS Flight International (ISSN 0015-3710), vol. 134, July 23, 1988, p. 22-26.

A flight test report is presented for the P.180 Avanti seven-seat executive aircraft, which is currently undergoing certification-related trials for entry into the U.S. market. Attention is given to the design details of this 'three-surface' canard-and-tailplane configuration, whose propulsion system encompasses two pusher turboprops mounted at the inboard portions of high aspect ratio (and accordingly high natural laminar flow) wings, as well as to the design's adequacy in the reconciliation of conflicting requirements for stability and high maneuverability. A climb to 27,000 ft was noted to take only 14 min from liftoff. A cruise of Mach 0.61 (370 kt) was then achieved. At the high altitude of 32,000 ft, Mach 0.635 (385 kt) was possible.
O.C.

A88-48471**CALCULATION OF AIRCRAFT FATIGUE AND DAMAGE TOLERANCE [CALCUL DES AVIONS EN FATIGUE ET EN TOLERANCE AUX DOMMAGES]**

C. PETIAU and R. J. CAZES (Avions Marcel Dassault Breguet Aviation, Saint-Cloud, France) Revue Francaise de Mecanique (ISSN 0373-6601), no. 1, 1988, p. 5-12. In French.

Classical fatigue analysis and damage tolerance methods for determining aircraft service life are reviewed for both metallic and composite structures. Limitations of the safe-life criteria and of crack initiation analysis methods based on the Wohler curves are pointed out. The more comprehensive fail-safe method involves the local stress analysis of critical zones, the calculation of stress intensity factors, and the analysis of crack propagation. Although

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

carbon-resin composites are not significantly affected by fatigue, in contrast to metallic materials, it is noted that the possibilities of damage by fabrication defects or accidental impact must be taken into account. R.R.

COMMERCIAL AIRCRAFT STRUCTURE FATIGUE - ANALYSIS OF EXPECTED IN-SERVICE LOADING AND THE PREDICTION OF STRUCTURAL COMPONENT BEHAVIOR [LA FATIGUE D'UNE STRUCTURE D'AVION CIVIL - ANALYSE DES SOLlicitATIONS ATTENDUES EN SERVICE ET PREVISIONS DU COMPORTEMENT DES ELEMENTS STRUCTURAUX]

B. HECIAK (Aerospatiale, Toulouse, France) Revue Francaise de Mecanique (ISSN 0373-6601), no. 1, 1988, p. 13-22. In French. refs

A method for incorporating fatigue and damage tolerance aspects into the design of the structure of a commercial aircraft is presented. Design goals include extending aircraft life without increasing mass. The development of calculation methods for analyzing the loading spectra which take into account the propagation delay phenomena is considered. The importance of acquiring material data on crack propagation and fatigue resistance using aircraft models is pointed out. The present method is demonstrated with the analysis of a structural detail of the A310-200. R.R.

INTEGRATED AIRCRAFT FLIGHT TEST APPROACHES FOR FAULT-TOLERANT AVIONICS SYSTEMS

SHAHID SIDDIQI (Aviation Advanced Technology Applications, Orlando, FL) and J. A. ABRAHAM (Illinois, University, Urbana) AIAA, Flight Test Conference, 4th, San Diego, CA, May 18-20, 1988. 8 p. refs (AIAA PAPER 88-2170)

Flight testing problems for highly integrated aircraft (aircraft in which sensors interface with data and control computers, which actuate reconfigurable controls) are reviewed. The flight test program for such aircraft must evolve techniques for reliably testing both the hardware and the software modules after they have been integrated into the aircraft. Some techniques based on the theory of fault tolerance are briefly discussed: these problems demand a more integrated flight-test team and approach than presently followed. A special flight simulator that is used to develop and test the software (in conjunction with the flight-test aircraft) is suggested. Author

INSIGHTS FROM LINEAR PREDICTIONS OF AIRCRAFT RESPONSE TO DAMAGED AIRFIELDS

JAMES J. OLSEN (USAF, Flight Dynamics Laboratory, Wright-Patterson AFB, OH) Journal of Aircraft (ISSN 0021-8669), vol. 25, May 1988, p. 413-419.

This paper examines the dynamic response of a simplified mathematical model of an aircraft that taxis over two arbitrary disturbances. It produces the idea of the bump multiplier that determines explicitly whether the second discrete disturbance will amplify or attenuate the response from the first disturbance. While the assumptions are very severe, the results can be useful to gain physical insight, to guide more elaborate nonlinear calculations, and to plan test programs. Author

SUPERMANEUVERABILITY - FIGHTER TECHNOLOGY OF THE FUTURE

WILLIAM D. SIURU, JR. Airpower Journal (ISSN 0897-0823), vol. 2, Spring 1988, p. 50-61. refs

Advanced 'Supermaneuverability' technologies, which are capable of accomplishing post-stall maneuvering in fighter aircraft combat situations, encompass the vectoring of engine thrust, the incorporation of control configured vehicle aerodynamic surfaces in addition to wings and empennage, and the use of novel wing structural concepts allowing mission-adaptive sweep and chamber changes. It is presently noted that the weakest point in the constitution of a supermaneuverable fighter, such as the X-31 that is currently under U.S./West German development, is the pilot, whose vulnerability to G-induced loss of consciousness will pose a constant problem. FUEL CONTAINMENT AND DAMAGE TOLERANCE IN LARGE COMPOSITE PRIMARY AIRCRAFT STRUCTURES. PHASE 2: TESTING

J. P. SANDIFER, A. DENNY, and M. A. WOOD Apr. 1985 278 p

(Contract NAS1-16856)

(NASA-CR-172519; NAS 1.26:172519) Avail: NTIS HC A13/MF A01 CSCL 01C

Technical issues associated with fuel containment and damage tolerance of composite wing structures for transport aircraft were investigated. Material evaluation tests were conducted on two toughened resin composites: Celion/HX1504 and Celion/5245. These consisted of impact, tension, compression, edge delamination, and double cantilever beam tests. Another test series was conducted on graphite/epoxy box beams simulating a wing cover to spar cap joint configuration of a pressurized fuel tank. These tests evaluated the effectiveness of sealing methods with various fastener types and spacings under fatigue loading and with pressurized fuel. Another test series evaluated the ability of the selected coatings, film, and materials to prevent fuel leakage through 32-ply AS4/2220-1 laminates at various impact energy levels. To verify the structural integrity of the technology demonstration article structural details, tests were conducted on blade stiffened panels and sections. Compression tests were performed on undamaged and impacted stiffened AS4/2220-1 panels and smaller element tests to evaluate stiffener pull-off, side load and failsafe properties. Compression tests were also performed on panels subjected to Zone 2 lightning strikes. All of these data were integrated into a demonstration article representing a moderately loaded area of a transport wing. This test combined lightning strike, pressurized fuel, impact, impact repair, fatigue and residual strength. M.G.

(Contract NAS2-12478)

(NASA-CR-177483-VOL-1; NAS 1.26:177483-VOL-1; DOT/FAA/PS-88/8-VOL-1; DOT/FAA/DS-88/2-VOL-1) Avail: NTIS HC A03/MF A01 CSCL 01C

This report analyzes the Zero/Zero Rotorcraft Certification Issues from the perspectives of manufacturers, operators, researchers and the FAA. The basic premise behind this analysis is the zero/zero, or at least extremely low visibility, rotorcraft operations are feasible today from both a technological and an operational standpoint. The questions and issues that need to be resolved are: What certification requirements do we need to ensure safety. Can we develop procedures which capitalize on the performance and maneuvering capabilities unique to rotorcraft. Will extremely low visibility operations be economically feasible. This is Volume 1 of three. It provides an overview of the Certification Issues Forum held in Phoenix, Arizona in August of 1987. It presents a consensus of 48 experts from government, manufacturer, and research communities on 50 specific Certification Issues. The topics of Operational Requirements, Procedures, Airworthiness, and Engineering Capabilities are discussed. Author

VIBRATION TESTING OF ACT FUSELAGE

In its JPRS Report: Science and Technology. Japan p 58-59 4
 May 1988 Transl. into ENGLISH from Kogiken Nyusu (Tokyo, Japan), Jan. 1988 p 10-11
 Avail: NTIS HC A06/MF A01

The ACT fuselage model vibration testing was done in order to determine the vibration characteristics of the whole fuselage model before wind tunnel testing and then feed them back into the data analysis. A special frame for vibration testing was set up, and in order to obtain the vibration characteristics at any

state during flight, sliding parts built into the model of the wind tunnel testing were used, only the front back and left right displacement of the model were constrained, and the center of gravity of the model was suspended with a spring coil in such a way as to not affect the vibration characteristics of the whole fuselage model. The vibration mode was determined using a small semiconductor gauge type accelerometer; 75 points on the entire fuselage were chosen as measurement points, and in taking measurements the positions of the detectors were moved about. The frequency response function was measured with a two channel Fast Fourier Transform analyzer, the modal analysis was done with a personal computer, and the modal parameters were determined, including the frequency, damping and vibration form. One-ninth scale wind tunnel model tests of the Propfan Test Assessment (PTA) aircraft were performed in three different NASA facilities. Wing and propfan nacelle static pressures, model forces and moments, and flow field at the propfan plane were measured in these tests. Tests started in June 1985 and were completed in January 1987. These data were needed to assure PTA safety of flight, predict PTA performance, and validate analytical codes that will be used to predict flow fields in which the propfan will operate. Author

FLIGHT RESEARCH AND TESTING

TERRILL W. PUTNAM and THEODORE G. AYERS Jun. 1988 24 p Presented at the Transonic Symposium, Hampton, Va., Apr. 1988
 (NASA-TM-100439; H-1483; NAS 1.15:100439) Avail: NTIS HC A03/MF A01 CSCL 01C

Flight research and testing form a critical link in the aeronautical R and D chain. Brilliant concepts, elegant theories, and even sophisticated ground tests of flight vehicles are not sufficient to prove beyond doubt that an unproven aeronautical concept will actually perform as predicted. Flight research and testing provide the ultimate proof that an idea or concept performs as expected. Ever since the Wright brothers, flight research and testing have been the crucible in which aeronautical concepts have advanced and been proven to the point that engineers and companies have been willing to stake their future to produce and design new aircraft. This is still true today, as shown by the development of the experimental X-30 aerospace plane. The Dryden Flight Research Center (Ames-Dryden) continues to be involved in a number of flight research programs that require understanding and characterization of the total airplane in all the aeronautical disciplines, for example the X-29. Other programs such as the F-14 variable-sweep transition flight experiment have focused on a single concept or discipline. Ames-Dryden also continues to conduct flight and ground based experiments to improve and expand the ability to test and evaluate advanced aeronautical concepts. A review of significant aeronautical flight research programs and experiments is presented to illustrate both the progress made and the challenges to come. Author

FLIGHT MECHANICS PANEL SYMPOSIUM ON ROTORCRAFT DESIGN FOR OPERATIONS: TECHNICAL EVALUATION REPORT

F. REINA (Agusta Sistemi S.p.A., Varese, Italy) Mar. 1988 17

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE

p Symposium held in Amsterdam, Netherlands, 13-16 Oct. 1986 (AGARD-AR-243; ISBN-92-835-0450-X) Avail: NTIS HC A03/MF A01

The expanding roles of the helicopter and the intensified threat perceived by its potential users have led to proposals for future rotorcraft with characteristics significantly different from existing types. The resulting rapid evolution of rotorcraft configurations, in response to user demands, now requires a translation into design criteria to permit the aerospace research and development community to provide appropriate and cost effective responses to these demands. The objective of this symposium is to explore the impact of operational needs on the evolution of rotorcraft design and to identify priorities and neglected topics. Three specific issues are central to this problem: (1) the translation of operational mission requirements into design criteria; (2) the evaluation of techniques to incorporate user defined needs into the design and methods of test and verification; and (3) the identification of design areas where unusual or new user needs are demanding special or radical features. All papers were obtained by invitation. The Conference Proceedings, commissioned by the AGARD Flight Mechanics Panel are published separately as AGARD CP 423. This Advisory Report was prepared at the request of the Flight Mechanics Panel of AGARD. Author

HOVER PERFORMANCE TESTS OF BASELINE METAL AND ADVANCED TECHNOLOGY BLADE (ATB) ROTOR SYSTEMS FOR THE XV-15 TILT ROTOR AIRCRAFT Final Report
K. BARTIE, H. ALEXANDER, M. MCVEIGH, S. LAMON, and H. BISHOP Oct. 1986 151 p
(Contract NAS2-11250)
(NASA-CR-177436; NAS 1.26:177436; D210-12380-1) Avail: NTIS HC A08/MF A01 C SCL 01C

Rotor hover performance data were obtained for two full-scale rotor systems designed for the XV-15 Tilt Rotor Research Aircraft. One rotor employed the rectangular planform metal blades (rotor solidity = 0.089) which were used on the initial flight configuration of the XV-15. The second rotor configuration examined the nonlinear taper, composite-construction, Advanced Technology Blade (ATB), (rotor solidity = 0.10) designed to replace the metal blades on the XV-15. Variations of the baseline ATB tip and cuff shapes were also tested. A new six-component rotor force and moment balance designed to obtain highly accurate data over a broad range of thrust and torque conditions is described. The test data are presented in nondimensional coefficient form for the performance results, and in dimensional form for the steady and alternating loads. Some wake and acoustic data are also shown. MULTIVARIABLE IDENTIFICATION OF A FLEXIBLE TRANSPORT AIRCRAFT

M. CLIQUE, G. MONNIER, M. LABARRERE, A. BUCCHARLES, and J. L. PAC (Ecole Nationale Supérieure de l'Aeronautique et de l'Espace, Toulouse, France) *In* DFVLR, System Identification in Vehicle Dynamics p 173-192 1987

Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

A method for the identification of multivariable linear systems is presented. Fourier analysis was used to obtain power spectral densities from measured signals and to compute each transfer function in the frequency domain. The modes of the system were located using Steiglitz identification techniques for the different input-output pairs. The proposed algorithm leads to the determination of a multivariable state space representation. The application to a flexible transport aircraft is given; the results show that the proposed method is adapted to multi-input, multi-output systems. ESA

A TWO-POINT AERODYNAMIC MODEL FOR IDENTIFICATION [EIN 2-PUNKT-AERODYNAMIKMODELL FUER DIE IDENTIFIZIERUNG]

W. MOENNICH *In its* System Identification in Vehicle Dynamics p 193-207 1987 In GERMAN

Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

An aerodynamic model for the identification of lateral aircraft

motion using maximum likelihood identification programs is presented, in which airfoil/fuselage and the horizontal tail surface are separated (two-point model). This separation allows one to consider several nonlinearities. The model takes into account elevator, elevator trimming, and direct lift control flap input signals as well as thrust effects on aerodynamics (interference between driving jet and horizontal tail surface). The method can be applied to all fixed-wing aircraft if compressibility effects can be neglected. The results show that a good or very good adaptation of the identification model output to the flight test measuring signals is obtained. The standard deviation of the identified parameters is so small that the reliability of the results can be considered as good. ESA

THE IDENTIFICATION OF THE DIRECT LIFT CONTROL FLAP SYSTEM OF THE RESEARCH AIRCRAFT ATTAS [ZUR IDENTIFIZIERUNG DES DLC-KLAPPENSYSTEMS DES FORSCHUNGSFLUGZEUGS ATTAS]

D. ROHLF and W. MOENNICH *In its* System Identification in Vehicle Dynamics p 209-222 1987 In GERMAN
Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

A simple replacement model for the direct lift control (DLC) flap control system was developed, and the DLC-flap efficiency of three landing flap positions was determined with a view to the identification of the ATTAS DLC-flap system. Starting from flight test data, a linear transfer behavior of second order in the frequency domain was determined; this model was extended by taking into account nonlinearities. The DLC-flap efficiencies were identified together with all other system parameters. Good adaptations to the time evolution, as well as small scatter in the identified parameters are obtained. The effect of the DLC-flap on buoyancy, drag, and pitching moment was determined as a function of the landing flap position. ESA

PARAMETRIC ESTIMATION OF AERODYNAMIC NONLINEARITIES IN ROLLING MOMENT DUE TO SIDESLIP USING MAXIMUM LIKELIHOOD METHOD

R. V. JATEGAONKAR *In its* System Identification in Vehicle Dynamics p 223-234 1987
Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

The utility of nonlinear maximum likelihood procedures for unconventional problems of estimating discontinuous complex aerodynamic nonlinearities is treated. It is demonstrated that a maximum likelihood procedure in which the need for explicit sensitivity equations is overcome by approximating the sensitivity coefficients through a numerical procedure can handle conveniently different general nonlinear system models. As examples cubic nonlinearity and aerodynamic hysteresis, characterized by a discontinuous relationship in rolling moment due to sideslip, which can possibly lead to uncommanded roll oscillations in aircraft motion, were identified from the simulated responses. ESA

FLIGHT TEST PREPARATION AND MEASURING DATA VALIDATION FOR PARAMETER IDENTIFICATION [FLUGVERSUCHSVORBEREITUNG UND MESSDATENUEBERPRUEFUNG FUER DIE PARAMETER-IDENTIFIKATION]

K.-O. PROSKAWETZ *In its* System Identification in Vehicle Dynamics p 235-249 1987 In GERMAN
Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

Flight test preparation and flight test data validation are

explained. Using the results of the process analysis, the excitation signals are optimized, the regulating variables are fixed, and the flight tests are planned. After the flight tests, the compatibility of the test data among each other is checked using a maximum likelihood identification program for nonlinear systems, and the errors are corrected. The procedure can also be applied to other domains of aircraft engineering in order to guarantee a high parameter estimation quality. ESA

N88-26530# Technische Hogeschool, Delft (Netherlands).
A NEW METHOD FOR THE ESTIMATION OF AIRCRAFT INERTIA CHARACTERISTICS

R. C. DEJONG and J. A. MULDER *In* DFVLR, System Identification in Vehicle Dynamics p 251-265 1987
Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

A method for the experimental determination of the aircraft center of gravity and the moments and products of inertia is presented and evaluated. The method is based on the application of statistical parameter estimation techniques to the analysis of multidegree of freedom oscillations using a high accuracy instrumentation system. A suspension rig, in which the aircraft can simultaneously rotate about the pitch and yaw axis and translate along the roll and pitch-axis was used to demonstrate the validity of the method. Inertia moments, inertia products, and the three coordinates of the center of gravity are simultaneously estimated from measurements of a single oscillation. The experiment is less time-consuming than previous methods, since no separate center-of-gravity nor rig reconfigurations are needed. ESA

N88-26532# Deutsche Forschungs- und Versuchsanstalt fuer Luft- und Raumfahrt, Brunswick (West Germany). Inst. fuer Flugmechanik.

UTILIZATION OF IDENTIFICATION METHODS IN THE TIME AND FREQUENCY DOMAIN FOR THE DETERMINATION OF THE XV-15 (TILT-ROTOR) DYNAMICS FOR LATERAL MOTION IN HOVER FLIGHT [ANWENDUNG VON IDENTIFIZIERUNGSVERFAHREN IM ZEIT- UND FREQUENZBEREICH ZUR BESTIMMUNG DER XV-15 (TILT-ROTOR) DYNAMIK FUER DIE SEITENBEWEGUNG IM SCHWEBEFLUG]

J. KALETKA and M. B. TISCHLER (Army Aviation Research and Development Command, Moffett Field, Calif.) *In its* System Identification in Vehicle Dynamics p 287-307 1987 In GERMAN; ENGLISH summary

Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

Mathematical models for the open loop dynamics of the XV-15 aircraft (tilt-rotor) were developed from flight test data using the frequency domain identification and the time domain identification approaches. The flight tests and the evaluation of test results are described. The results from the two approaches compare favorably. However, the differences clearly demonstrate the effects of the inherent weighting of each individual technique; they also indicate the relative strengths and weaknesses of the approaches. Based on the results a proposal for a coordinated system identification approach, using the advantages of both methods is given. ESA

A PILOT'S PERSPECTIVE OF THE ADVANCED FIGHTER TECHNOLOGY INTEGRATION AUTOMATED MANEUVERING ATTACK SYSTEM

MARK STUBBEN (USAF, Flight Test Center, Edwards AFB, CA) SAE, Aerospace Vehicle Conference, Washington, DC, June 8-10, 1987. 11 p.
(SAE PAPER 871349)

The Advanced Fighter Technology Integration (AFTI)/F-16 test program conducted developmental test flights on new technologies designed to enhance the weapons system effectiveness and survivability of fighter aircraft. This paper will focus on the pilot acceptance of the new technologies integrated into the automated maneuvering attack system (AMAS), to include pilot confidence in flying an automated maneuvering system at low altitude; pilot acceptance of automated flying qualities; and pilot-to-vehicle interface consideration including avionics integration, cockpit controls, cockpit displays, and voice actuated avionics. SIMULATION OF CLUTTER RETURN FOR AN AIRBORNE PULSE DOPPLER RADAR

ROGER E. WAKEFIELD (Mitre Corp., Bedford, MA) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 251-255. USAF-supported research. refs

This paper describes a clutter simulation computer program developed for the analysis of airborne pulse Doppler radar with a broadside pointing antenna. The program was developed on a VAX 8200 computer and executed on an AT&T 6300 personal computer (PC) with the arithmetic coprocessor. Phased array radars of various sizes, operating at different radar frequencies and pulse repetition frequencies (PRFs) were analyzed. Horizontal and vertical gain patterns are individually specified. Distributed clutter from ground and birds is modeled. Clutter cross section versus frequency (Doppler shift) is stored and plotted for analysis. The results proved useful in the determination of target detection capability. Performance against the original goals of fast execution and accurate results are discussed. Author

SIMULATION OF AN AIR-TO-AIR TRACKING SYSTEM FOR AN ELECTRONICALLY STEERED ANTENNA

JAMIL R. HASHIMI, SAMUEL S. BLACKMAN, and STUART P. ICKOVIC (Hughes Aircraft Co., Los Angeles, CA) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 279-284.

A simulation was developed for an air-to-air multiple target tracking (MTT) system that uses an electronically steered antenna (ESA), which offers an advantage over the conventional mechanically steered antenna (MSA) in that it has the ability to reposition the radar beam almost instantaneously without overshooting the desired beam position. The results of Monte Carlo simulation, used to weigh the relative benefits of improved tracking performance versus the developmental and computational costs of employing the ESA, demonstrated that the ESA MTT system can be expected to provide significantly improved performance over that of a typical MSA track-while-scan system. The simulation makes it possible to evaluate future system enhancements. Block diagrams are presented. I.S.

THE DEVELOPMENT OF A DIRECTIONAL GYROSCOPE FOR REMOTELY PILOTTED VEHICLES AND SIMILAR APPLICATIONS

D. W. ALFORD (Ferranti Instrumentation, Ltd., Bracknell, England) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 1-8. Research supported by the Ministry of Defence Procurement Executive.

The paper describes the development of a small, light, rugged, d.c. powered, two gimbal gyroscope that incorporates new technology features to improve its performance. These include a precision low noise multiple wiper linear potentiometer pick-off on the azimuth axis and an additional potentiometer pick-off on the inner gimbal axis for the approximate correction of the geometric heading errors due to airframe pitch and roll motion. A novel pneumatic pulse-torque inner gimbal erection system enables in-flight performance to be improved. Author

A TWO DEGREE OF FREEDOM GYROSCOPE WITH FRICTIONLESS INNER AND OUTER GIMBAL PICK-OFFS

R. E. J. SWAIN (British Aerospace, PLC, Stevenage, England) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 9-16. Research supported by the Ministry of Defence Procurement Executive.

A two degree of freedom gyroscope for rapid start, short operating time, applications is described. Design features include thermoplastic gimbals with in situ moulded bearings, stored energy power sources in the form of either a spring or high pressure cold gas, obtained from a superplastic formed titanium pressure vessel, and noncontacting pick-offs. Inner gimbal angle is derived from a mark to space signal which is modulated linearly by areas of differing reflectivity on the surface of a spherical rotor. The outer gimbal pick-off is an absolute encoder which obtains multitrack accuracy from a single track by using a scale coded with a pseudorandom binary sequence. Author

OSCILLOGYRO DESIGN, MANUFACTURE AND PERFORMANCE

J. WELLBURN and D. A. REID (Ferranti Defence Systems, Ltd., Edinburgh, Scotland) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 17-27.

The Oscillogyro is a two-degree of freedom, dry tuned, displacement gyroscope of unorthodox design, capable of

temperature wild operation. The principles of operation are explained together with details of design and manufacture. Many applications have been found for the instrument ranging from a 1 nm/hr accuracy inertial navigation system to an oil well survey tool. All applications require good performance and modelable characteristics over a wide temperature range. A description of the automatic test equipment required to characterize each instrument is given. Aspects of instrument serviceability are discussed and the main failure mechanisms examined. Author

A88-47199**A LOW COST OPTICAL ALTIMETER FOR RPV APPLICATIONS**

J. MANSBRIDGE and G. M. S. JOYNES (Plessey Electronic Systems Research, Ltd., Romsey, England) IN: Remotely piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Supplementary Papers. Bristol, England, University of Bristol, 1987, p. 18.1-18.4.

An account is given of the design features and performance capabilities of an optical altimeter, for use by towed or remotely piloted targets simulating sea-skimming missiles, which can be manufactured significantly more cheaply than existing radar altimeters. Altitude is measured by means of a CW subcarrier modulation scheme. Attention is given to the effects of weather conditions on the operating envelope of such an altimeter, as well as to its optical components' configuration and signal processing system. While the altimeter was designed primarily for use over the sea surface, it will yield acceptable performance in overland flight. O.C.

AIRCRAFT FIELD DEGRADATION AND ELECTROMAGNETIC COMPATIBILITY

K. H. CAVCEY and D. S. FRIDAY Jan. 1988 100 p Sponsored by Army Aviation Systems Command, St. Louis, Mo. (PB88-183975; NBSIR-88/3083) Avail: NTIS HC A05/MF A01 CSDL 01D

The paper discusses the first tests undertaken to study the problem of field degradation in army aircraft (helicopters and one fixed wing airplane) due to the deterioration of electronic and electrical systems. The electromagnetic compatibility (EMC) of such systems was investigated by passive measurement of the aircraft as a collection of radio frequency sources. Methods for detection of these sources were developed that included sensitivity to both stationary and nonstationary noise that existed. The collected data were studied to see if there existed any obvious factors derived from the data that one could use to correct potential problems that might affect flight safety. Emphasis was placed upon making such test methods appropriate, inexpensive, and easily performed by army field personnel. In addition, applications to quality control or acceptance testing, as related to the Environmental Stress Screening (ESS) program, were examined. GRA

DEVELOPMENT OF AN AIRBORNE FACILITY FOR ADVANCED AVIONICS RESEARCH

N. VANDRIEL 1 Mar. 1987 17 p Presented at the 53rd AGARD Avionics Panel Symposium, Las Vegas, Nev., 27 Apr. - 1 May 1987 Previously announced in IAA as A88-23801 (NLR-MP-87012-U; B8803804; ETN-88-92607) Avail: NTIS HC A03/MF A01

A program to equip an aircraft with avionics research instruments is outlined. A Fairchild Metro 2 will be equipped with a programmable electronic flight instrument system (EFIS), programmable flight management computer (FMC), programmable flight control computer, Navstar GPS, microwave landing system (MLS), and a digital data link. Applications of the system include: research on MLS approaches (e.g., interception angles, segment lengths and orientations, equipment requirements); research on the use of EFIS, for conventional and unconventional presentations; research on the use of digital data links; research on the use of

FMC's; and research on the use of satellite navigation systems especially for RNAV operations and approaches. ESA

AIRCRAFT PROPULSION AND POWER

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

A88-46075**THEORY AND DESIGN OF JET ENGINES (SECOND REVISED AND ENLARGED EDITION) [TEORIJA I RASCHET VOZDUSHNO-REAKTIVNYKH DVIGATELEI /2ND REVISED AND ENLARGED EDITION/]**

S. M. SHLIAKHTENKO, ED. Moscow, Izdatel'stvo Mashinostroenie, 1987, 568 p. In Russian. No individual items are abstracted in this volume.

The theory behind various types of jet engines is elaborated, with attention given to the thermodynamic-cycle characteristics and principles for choosing optimal parameters. Particular consideration is given to the specific parameters of gas turbine engines (GTEs), the operating characteristics of GTDs, ramjet and combination turbojet/ramjet engines, and the theoretical principles behind the design of GTEs. B.J.

A88-46348**THRUST-REVERSE EFFICIENCY [EFFICACITE DES INVERSEURS]**

C. CASTAN (Aerospatiale, Toulouse, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 54 p. In French. (AAAF PAPER NT-87-24)

Experimental data and simulation results on thrust reversers have been obtained in order to study their braking efficiency and problems such as reingestion, failure in flight, loading, the effect of reverse flows on the control systems, and the accidental opening of the thrust reverser in flight. Thrust-reverser concepts considered include the cascade thrust reverser, the pivoting-door fan-stream thrust reverser used on the A320, and the pivoting-clamshell thrust reverser for the combined core/fan flow. The simulation employing a turbine-powered model is found to provide a good representation of real phenomena and to confirm flight results obtained in a wind tunnel. Disadvantages of the 'blown jet' test method are pointed out. F.R.

A88-46491*# Boeing Commercial Airplane Co., Seattle, Wash. SUPERSONIC PROPULSION SYSTEMS AND COMMUNITY NOISE SUPPRESSION CONCEPTS

GENE L. NIHART and JEFFREY J. BROWN (Boeing Commercial Airplane Co., Seattle, WA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 9 p. refs

(Contract NAS1-18377) (AIAA PAPER 88-2986)

After a brief evaluation of advanced SST propulsion cycles, the ability of various alternative designs to meet community noise suppression requirements during prospective international airport operations are discussed. Attention is given to the noise suppression features that may allow SST variable thermodynamic cycle engines incorporating numerous variable-geometry features to expose airport communities to noise levels no greater than those of current wide-body subsonic airliners. O.C.

A88-46492#**PERFORMANCE EVALUATION OF A TWO DIMENSIONAL CONVERGENT-DIVERGENT EJECTOR EXHAUST SYSTEM**

JOHN F. FEDERSPIEL and ANDREW P. KUCHAR (General Electric

07 AIRCRAFT PROPULSION AND POWER

Co., Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 11 p. (AIAA PAPER 88-2999)

The results of a parametric test of two-dimensional convergent-divergent (2DCD) ejector nozzles are presented. Data were obtained from scale model cold flow testing. The geometries tested were representative of current technology aircraft engine nozzles. The thrust and pumping performance trends with geometry and with operating levels are shown and compared to those of axisymmetric ejector nozzles of similar geometry obtained from a statistical data base. The performance characteristics of axisymmetric ejector nozzles had been extensively investigated and well documented. However, very little test data existed for 2DCD ejector nozzles. The 2DCD nozzles showed slightly higher thrust levels but overall, comparisons were well within a range expected by statistical error. Pumping/air handling performance was comparable. Author

OVERVIEW OF FLIGHT TESTING OF GE AIRCRAFT ENGINES' UDF ENGINE

CARLYLE REID (General Electric Co., Cincinnati, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 13 p. (AIAA PAPER 88-3082)

This paper provides a brief overview of the results of the two flight test programs completed on the (UDF) proof-of-concept demonstrator engine. This is a revolutionary engine featuring directly driven (i.e., no gearbox) counterrotating, ultra-high bypass, variable-pitch, unducted fans. With a propulsive efficiency in the mid-90-percent range at subsonic speeds equivalent to current turbofan-powered aircraft, this engine provides the next major breakthrough in fuel efficiency for commercial and military subsonic transports. Flight testing in a modified B727 and MD-80 successfully checked out the engine and associated aircraft characteristics with respect to operability, performance and acoustic signatures. The capability of projecting installed altitude flight performance and acoustic characteristics from scale model wind tunnel and full scale sea level bench testing was also confirmed. Future potential commercial and military applications for a product UDF engine and planned test activity for the demonstrator, engines and wind tunnel models are presented. Author

UNIQUE TRANSIENT COMBUSTOR TEST CAPABILITY

T. J. ROSFJORD, J. HALEY, JR. (United Technologies Research Center, East Hartford, CT), and J. M. BONNELL (Pratt and Whitney, West Palm Beach, FL) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 11 p. (AIAA PAPER 88-3197)

An account is given of the design features and performance capabilities of a test apparatus able to obtain controlled airflow and fuel-flow rate transients in combustor models; these transients may be either monotonic or oscillatory, or a combination of the two. A time variation of the combustor inlet air is also obtainable. A dedicated control system furnishes modes for transient profile development, manual, and automatic operation. All operational modes have been experimentally verified. O.C.

PROPULSION CONTROL SPECIFICATIONS IN INTEGRATED FLIGHT PROPULSION CONTROL SYSTEMS

STEPHEN M. ROCK, ABBAS EMAMI-NAEINI, and ROBERT P. ANEX (Systems Control Technology, Inc., Palo Alto, CA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 12 p. Research supported by Systems Control Technology, Inc. refs (AIAA PAPER 88-3236)

A technique is presented for generating specifications that define how subsystems must perform within an integrated control system in order to assure performance goals are met when the integrated system is implemented. These specifications provide the mechanism for communicating performance requirements and

operational constraints that account for coupling and modeling uncertainties. The advantage of these specifications is that they make it possible to partition large control design problems into elements that can be addressed by individual experts. An example of the application of this procedure to an integrated flight/propulsion control problem is presented. Author

AN ENGINEERING MODEL FOR ANALYSIS OF SCRAMJET COMBUSTOR PERFORMANCE WITH FINITE RATE CHEMISTRY

MARIA V. PULSONETTI, JOHN I. ERDOS, and KEVIN EARLY (General Applied Science Laboratories, Inc., Ronkonkoma, NY) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 14 p. Research supported by Pratt and Whitney and USAF. refs (AIAA PAPER 88-3258)

An engineering model of diffusion and reaction-limited supersonic combustion is described. The key feature of this model is that it divides the flowfield into three parallel, one-dimensional streams: one is the fuel stream, another is the oxidizer stream and the third is the product stream. Fuel and oxidizer are continuously fed into the product stream in accordance with an empirical mixing model and allowed to react at finite rate. Comparisons with experimental data for hydrogen-air combustion are presented. The model is clearly over-simplified compared to the complex two- and three-dimensional turbulent mixing and induced shock train processes known to exist in supersonic combustors. Nevertheless it includes sufficient physics to provide reasonably good agreement with the data and enables rapid interpretation of the global features of the experiments. Accordingly it may be useful in conceptual design studies. Author

ACTIVE-CONTROL ENGINES

LEE PADDON Flight International (ISSN 0015-3710), vol. 134, July 9, 1988, p. 33, 34.

Full-authority digital engine controllers (FADECs) of the simplest type are direct replacements for their hydromechanical counterparts, monitoring various engine parameters as well as the throttle setting to control the amount of fuel entering an aircraft engine; they allow a pilot to move the throttle instantaneously from idle to wide-open settings without ill effects. As FADECs assume more control functions, their current multichannel-redundancy system will have to be extended to enhance safety. Eventually, pilot control inputs will constitute instructions to a computer which will in turn optimize the most effective way of achieving the desired effects, in view of existing engine operation and aerodynamic constraints. O.C.

HIGH-TEMPERATURE DIMENSIONING OF TURBINE DISKS [DIMENSIONNEMENT A CHAUD DES DISQUES DE TURBOMACHINES]

A. BOUCHERIT and J.-P. MASCARELL (SNECMA, Moissy-Cramayel, France) Revue Francaise de Mecanique (ISSN 0373-6601), no. 1, 1988, p. 23-28. In French. refs

A dimensioning procedure for investigating the temporal evolution of the damage and viscoplastic behavior of an experimental disk subjected to the high-temperature multiaxial loading conditions characteristic for turbine disks is presented. The dimensioning philosophy for predicting life duration is discussed. A finite element analysis performed on a model disk made of INCO 718 reveals the values of parameters, associated with the stabilized cycle, which are used to calculate the fatigue life duration of two critical zones of the disk. It is noted that the large number of cycles which must be calculated in order to determine the stabilized response makes this type of analysis relatively expensive. R.R.

EXPERIMENTAL VIBRATION DAMPING CHARACTERISTICS OF THE THIRD-STAGE ROTOR OF A THREE-STAGE TRANSONIC AXIAL-FLOW COMPRESSOR

FREDERICK A. NEWMAN (NASA, Lewis Research Center, Cleveland, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 23 p. Previously announced in STAR as N88-24642. refs (AIAA PAPER 88-3229)

Rotor blade aerodynamic damping is experimentally determined in a three-stage transonic axial flow compressor having design aerodynamic performance goals of 4.5:1 pressure ratio and 65.5 lbf/sec weight flow. The combined damping associated with each mode is determined by a least squares fit of a single degree of freedom system transfer function to the nonsynchronous portion of the rotor blade strain gage output power spectra. The combined damping consists of the aerodynamic damping and the structural and mechanical damping. The aerodynamic damping varies linearly with the inlet total pressure for a given corrected speed, weight flow, and pressure ratio while the structural and mechanical damping is assumed to remain constant. The combined damping is determined at three inlet total pressure levels to obtain the aerodynamic damping. The third-stage rotor blade aerodynamic damping is presented and discussed for the design equivalent speed with the stator blades reset for maximum efficiency. The compressor overall performance and experimental Campbell diagrams for the third-stage rotor blade row are also presented. Author

EXPERIMENTAL INVESTIGATION OF THREE-DIMENSIONAL FORCED MIXER LOBE FLOW FIELDS

S. A. SKEBE, R. W. PATERSON, and T. J. BARBER (United Technologies Research Center, East Hartford, CT) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1999-2006. refs (AIAA PAPER 88-3785)

This paper describes an experimental investigation of three-dimensional flow field development within contoured lobes similar to those employed in turbofan forced mixer nozzles and mixer-ejectors. Laser Doppler Velocimetry and total pressure loss measurements were performed on several lobe configurations in order to elucidate the underlying physics of the forced mixing flow process and to establish data sets suitable for the development of related computational fluid dynamic procedures. A principal result of this study is that the flows within forced mixers are predominantly inviscid, with boundary layer effects confined to lobe surface regions. Thus, the streamwise vortex array emanating from the trailing edge of such convoluted lobe surfaces is basically inviscid in origin. Author

OVERVIEW OF NASA RESEARCH IN FIBER OPTICS FOR AIRCRAFT CONTROLS

GARY T. SENG 1988 9 p Proposed for presentation at the ISA/88 International Conference and Exhibit, Houston, Tex., 16-21 Oct. 1988; sponsored by the Instrument Society of America (NASA-TM-100919; E-4156; NAS 1.15:100919) Avail: NTIS HC A02/MF A01 CSCL 01C

The challenge of those involved in aircraft control system hardware development is to accommodate an ever-increasing complexity in aircraft control, while limiting the size and weight of the components and improving system reliability. A technology that displays promise towards this end is fiber optics. The primary advantages of employing optical fibers, passive optical sensors and optically controlled actuators are weight/volume reduction, immunity from electromagnetic effects, high bandwidth capabilities and freedom from short circuits/sparking contacts. Since 1975, NASA Lewis has been performing in-house, contract and grant research in fiber optic sensors, high temperature electro-optic switches and fly-by-light control system architecture. Passive optical sensor development is an essential yet challenging area of work and has therefore received much attention during this period. A major effort to develop fly-by-light control system technology, known as the Fiber Optic Control System Integration (FOCSI) program, was initiated in 1985 as a cooperative effort between NASA and DOD. Phase 1 of FOCSI, completed in 1986, was aimed at the design of a fiber optic integrated propulsion/flight control system. Phase 2 will provide subcomponent and system development and system testing. In addition to a summary of the benefits of fiber optics, the FOCSI program, sensor advances, and future directions in the NASA Lewis program are discussed. Author

AN EFFICIENT COMPUTATIONAL TOOL FOR RAMJET COMBUSTOR RESEARCH

S. P. VANKA, J. L. KRAZINSKI, and A. S. NEJAD 1988 14 p Presented at the 26th AIAA Aerospace conference, Reno, Nev., 10 Jan. 1988 (Contract W-31-109-ENG-38) (DE88-010034; CONF-880139-4; AIAA-88-0060) Avail: NTIS HC A03/MF A01

A multigrid based calculation procedure is presented for the efficient solution of the time-averaged equations of a turbulent elliptic reacting flow. The equations are solved on a non-orthogonal curvilinear coordinate system. The physical models currently incorporated are a two equation k-epsilon turbulence model, a four-step chemical kinetics mechanism, and a Lagrangian particle tracking procedure applicable for dilute sprays. Demonstration

calculations are presented to illustrate the performance of the calculation procedure for a ramjet dump combustor configuration.

ENGINE COMPONENT RETIREMENT FOR CAUSE. VOLUME 1: EXECUTIVE SUMMARY Final Report, Aug. 1980 - Nov. 1986
JOHN A. HARRIS, JR. Aug. 1987 60 p
(Contract F33615-80-C-5160)
(AD-A192730; PWA-FR-18301-VOL-1; AFWAL-TR-87-4069-VOL-1)
Avail: NTIS HC A04/MF A01 CSCL 21E

This program developed and integrated materials behavior characteristics, component life analysis, nondestructive evaluation and cost-risk technology to establish and demonstrate the retirement for cause maintenance concept as it applies to rotating components of military gas turbine engines. As such it provides the basis for elimination of classical time or cyclic limits currently imposed for retirement of gas turbine rotor components by substituting a life management system in which each individual component is retired from service when the unique, economical safe life of that component is exhausted. The methodology was demonstrated on and validated for the U.S. Air Force F100 engine's rotor components and has been implemented on that engine system by the USAF Air Logistics Command. Use of Retirement for Cause is projected to result in life cycle cost savings in excess of \$1 billion for that engine-system. The Retirement for Cause methodology developed is generic, and may be applied to not only other gas turbine engines, but to components of any life limited system.

CORROSION PREVENTION IN GAS TURBINES
A. J. A. MOM 13 May 1987 36 p In DUTCH; ENGLISH summary Presented at the Corrosiedag 1986 van de NCC-sector Energie, Arnhem, Netherlands, 16 Sep. 1986
(NLR-MP-87029-U; B8805308; ETN-88-92611) Avail: NTIS HC A03/MF A01

Corrosion prevention and reduction in gas turbines is discussed. Preventative measures concentrate on the environment in the gas turbine, using filters, washing, scouring with rice husks, choice of fuel. Corrosion can be mitigated by the use of coatings or other materials. Good corrosion prevention requires developing an integral plan whereby the effects of the various preventive measures and the costs entailed are reviewed and considered as a whole.

SYNTHESIS OF AN ADAPTIVE FLIGHT CONTROLLER UNDER UNKNOWN DETERMINISTIC DISTURBANCES
KIMIO KANAI, SHIGERU UCHIKADO (Defense Academy, Yokosuka, Japan), PETER N. NIKIFORUK, and NORIYUKI HORI (Saskatchewan, University, Saskatoon, Canada) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 31, May 1988, p. 1-17. refs

Two methods of designing an adaptive flight control system are developed using an algebraic polynomial method. The first is based on the direct control method, which identifies the plant parameters implicitly, and the second on the indirect method, which does this explicitly. The controllers which are designed using these schemes are able to take account of the uncertainties in the aircraft's stability and control derivatives, and are robust against

the deterministic disturbances. Their application to the flight control of small, high-performance aircraft is examined using numerical simulations which show that the proposed schemes are effective.

LARGE MOTION ROBUST FLIGHT CONTROL OF AIRCRAFT BY EQUIVALENT NONLINEAR ELIMINATION
SHOKICHI KANNO (Ichinoseki National College of Technology, Japan) and TATSUO CHUBACHI (Iwate University, Ueda, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 31, May 1988, p. 48-60. refs

This paper is concerned with the large motion robust flight control of aircraft by the theory of approximate perfect servo and equivalent nonlinear elimination method. The perfect servo means that the transfer matrix is $I(m)$, and the output, follows asymptotically any bounded arbitrary command inputs. The nonlinear dynamics of aircraft are equivalently eliminated by the equivalent elimination, and this operation does not need any numerical computation of aircraft dynamics. This system is robust and stable, being indifferent to the change of flight conditions and to the variation of aircraft dynamics. Simulations about a high speed aircraft showed very good results.

BOWLES (NASA, Langley Research Center, Hampton, VA) Journal of Guidance, Control, and Dynamics (ISSN 0731-5090), vol. 11, July-Aug. 1988, p. 320-327. Research supported by Boeing Commercial Airplane Co. and Air Line Pilots Association. refs
(Contract NAG1-516)

This paper is concerned with guidance strategies for near-optimum performance in a windshear. The takeoff problem is considered with reference to flight in a vertical plane. In addition to the horizontal shear, the presence of a downdraft is assumed. A gamma guidance scheme, based on the absolute path inclination, is presented. This approach needs local information on the windshear and the downdraft. The gamma guidance scheme produces trajectories that preserve the basic properties of the optimal trajectories. The relation between the gamma guidance scheme and the acceleration guidance scheme is explored. In logic, these two guidance schemes are complementary to one another; in implementation, they yield almost identical results. Although local information on the windshear and the downdraft will be available in future aircraft, it might not be available on current aircraft. Hence, a simplified gamma guidance scheme (quick transition to horizontal flight) is presented which is useful for flight in severe windshears. The simplified gamma guidance scheme yields trajectories that are close to the optimal trajectories in severe windshears; in addition, it is easy to implement as a practical piloting technique.

ANALYTICAL REDUNDANCY USING BAND-LIMITING FILTERS
J. G. JONES and M. J. CORBIN (Royal Aircraft Establishment, Farnborough, England) IEE Proceedings, Part D - Control Theory and Applications (ISSN 0143-7054), vol. 135, pt. D, no. 4, July 1988, p. 257-267. refs

The paper presents a method in which control system faults may be detected on the basis of the generation and crosscomparison of bandlimited signals from dissimilar sources. While signals measured at different points in the system may differ widely when viewed over a wide bandwidth, it is shown that, over limited pass bands, there are simple relationships that can be verified by means of appropriate filtering and comparison logic. In effect, the band-limiting filters are used to monitor the propagation of information originating in the structure of external inputs through the system. K.K.

ANALYSIS OF THE TECHNIQUE OF ROBUST EIGENSTRUCTURE ASSIGNMENT WITH APPLICATION TO AIRCRAFT CONTROL

S. K. MUDGE and R. J. PATTON (York, University, England) IEE Proceedings, Part D - Control Theory and Applications (ISSN 0143-7054), vol. 135, pt. D, no. 4, July 1988, p. 275-281. refs

Given the linear state-space representation of a dynamic system, a method for computing allowable eigenvector subspaces using singular value decomposition for both real and complex eigenvalues is illustrated. Once these spaces have been determined, it is possible to assign the eigenvectors in two ways: one which performs desirable weightings of the system states for each mode permitting system decoupling, and the second which assigns eigenvectors iteratively to make the corresponding eigenvalues as insensitive to perturbations in the system matrices as possible. A computational procedure for each of these techniques is described. The work is illustrated using the stability augmentation system control design problem for the lateral motion model of a nonlinear aircraft system. The modal requirements for this problem are well known, and this enables a comparison of the two methods to be made. Author

FLUTTER SUPPRESSION WITHIN REACH

HOLT ASHLEY (Stanford University, CA) Aerospace America (ISSN 0740-722X), vol. 26, Aug. 1988, p. 14-16.

The control of aeroelastic degrees-of-freedom in currently operational aircraft can be reliably and advantageously achieved through application of the principles of aeroservoelasticity. It is presently noted that flutter suppression can be made part of active control in future aircraft from the outset of preliminary design. The technologies required encompass highly redundant and benignly degrading avionics, high-bandwidth sensors and aerodynamic surface actuators, and optimum control laws for the system software that maximize hydraulic power savings. O.C.

FILLING THE EXPERTISE GAP

IRVING ABEL (NASA, Langley Research Center, Hampton, VA) Aerospace America (ISSN 0740-722X), vol. 26, Aug. 1988, p. 16, 17.

Aeroelasticity, structures, and stability-and-control specialists

can work in concerted fashion during the early design phases of future aircraft to achieve active control of naturally unstable configurations. In order to take full advantage of active control, attention must be given by designers to control-law synthesis, and to tools for the efficient synthesis and analysis of complex flexible-aircraft control systems. Analysts must consider interfaces among unsteady aerodynamics, structures, and control theory, as explored by the theory of analytic continuation for unsteady aerodynamics. O.C.

COUPLING STRUCTURE AND CONTROLS DESIGN

TERRENCE A. WEISSHAAR (Purdue University, West Lafayette, IN) Aerospace America (ISSN 0740-722X), vol. 26, Aug. 1988, p. 18, 20.

While it is in principle easy to mathematically optimize both aircraft structures and control laws simultaneously, by adding measures of control performance to measures of structural performance to arrive at a global cost function, the interdisciplinary complexity of actual projects defies such straightforward treatment. Attention is presently given to the 'multilevel decomposition' approach developed at NASA-Langley, in which a chief engineer coordinates various disciplinary design groups and chooses, if necessary, a less-than-desirable solution in a given discipline for the sake of overall cohesiveness. The various groups also share a common data base. O.C.

ACTIVE CONTROL IN TOMORROW'S MARKETPLACE

NICK A. RADOVICH (Lockheed Aeronautical Systems Co., Sunland, CA) Aerospace America (ISSN 0740-722X), vol. 26, Aug. 1988, p. 20, 22.

Aeroservoelastic solutions to fundamental aircraft design problems are in competition with the potential contributions of advanced materials, aeroelastic tailoring, and improved aerodynamics; aeroservoelasticians must accordingly engage emergent configuration design opportunities for active control system application at the outset of the design process. While active control reliability of the order of 10 to the -6th may be adequate for gust or maneuver loads control, aeroservoelastic stability (flutter) control applications will require the reliability levels of basic structure if flutter speeds without active control exist within the flight envelope in question. O.C.

A DECENTRALIZED APPROACH TO AUTOMATIC FLIGHT CONTROL DESIGN

M. VUKOBRADOVICH and R. STOJICH Academie Serbe des Sciences et des Arts, Bulletin, vol. 93, Classe des Sciences Techniques (ISSN 0490-642X), no. 23, 1987, p. 45-66. refs

An approach to decoupled control of large-scale nonlinear systems is applied to a dynamic flight control. Control synthesis is performed in two steps. First, the nominal, programmed control is synthesized using the complete model of flight dynamics. At the second step the tracking of the nominal trajectory is realized. The system is viewed as a set of decoupled subsystems and, for each subsystem, local control is synthesized. Then, the stability of the overall system is analyzed and the global control is introduced to compensate for coupling among some of the subsystems. A simulation of flight control with the proposed control law is presented. Author

QUASI-STEADY FLIGHT TO QUASI-STEADY FLIGHT TRANSITION FOR ABORT LANDING IN A WINDSHEAR - TRAJECTORY OPTIMIZATION AND GUIDANCE

A. MIELE, T. WANG (Rice University, Houston, TX), and W. W. MELVIN (Delta Air Lines, Inc., Atlanta, GA) Journal of Optimization Theory and Applications (ISSN 0022-3239), vol. 58, Aug. 1988, p. 165-207. Research supported by Boeing Commercial Airplane Co. and Air Line Pilots Association. refs (Contract NAG1-516)

Trajectory optimization and trajectory-guidance problems for abort-landing maneuvers in the presence of low-altitude wind shear are investigated by means of numerical simulations, with a focus on methods designed to achieve quasi-steady flight recovery (final values of the relative velocity, path inclination, and angle of attack equal to those for quasi-steady steepest climb). The derivation of the governing equations is outlined; the modeling techniques are explained; and results for a B-727 transport aircraft approaching a sea-level airfield at temperature 100 F are presented in extensive tables and graphs and characterized in detail. The techniques developed are shown to be effective in restoring the aircraft to stable quasi-steady flight. T.K.

FLIGHT-MANAGEMENT STRATEGIES FOR ESCAPE FROM MICROBURST ENCOUNTERS M.S. Thesis - George Washington Univ.

DAVID A. HINTON Aug. 1988 29 p (NASA-TM-4057; L-16448; NAS 1.15:4057) Avail: NTIS HC A03/MF A01 CSCL 01C

An effort is underway by NASA, FAA, and industry to reduce the threat of convective microburst wind shear phenomena to aircraft. The goal is to develop and test a candidate set of strategies for recovery from inadvertent microburst encounters during takeoff. Candidate strategies were developed and evaluated using a fast-time simulation consisting of a simple point-mass performance model of a transport-category airplane and an analytical microburst model. The results indicate that the recovery strategy characteristics that best utilize available airplane energy include an initial reduction in pitch attitude to reduce the climb rate, followed by an increase in pitch up to the stick shaker angle of attack. The stick shaker angle of attack should be reached just as the airplane is exiting the microburst. The shallowest angle of climb necessary for obstacle clearance should be used. If the altitude is higher than necessary, an intentional descent to reduce the airspeed deceleration should be used. Of the strategies tested, two flight-path-angle based strategies had the highest recovery altitudes and the least sensitivity to variations in the encounter scenarios. Author

LOW-SPEED WIND-TUNNEL TEST OF A STOL SUPERSONIC-CRUISE FIGHTER CONCEPT

PAUL L. COE, JR. and DONALD R. RILEY Jul. 1988 43 p (NASA-TM-4050; L-16422; NAS 1.15:4050) Avail: NTIS HC A03/MF A01 CSCL 01C

A wind-tunnel investigation was conducted to examine the low-speed static stability and control characteristics of a 0.10 scale model of a STOL supersonic cruise fighter concept. The concept, referred to as a twin boom fighter, was designed as a STOL aircraft capable of efficient long range supersonic cruise. The configuration name is derived from the long twin booms extending aft of the engine to the twin vertical tails which support a high center horizontal tail. The propulsion system features a two dimensional thrust vectoring exhaust nozzle which is located so that the nozzle hinge line is near the aircraft center of gravity. This arrangement is intended to allow large thrust vector angles to be used to obtain significant values of powered lift, while minimizing pitching moment trim changes. Low speed stability and control information was obtained over an angle of attack range including the stall. A study of jet induced power effects was included. Author

CONTROL OF FLIGHT THROUGH MICROBURST WIND SHEAR USING DETERMINISTIC TRAJECTORY OPTIMIZATION Ph.D. Thesis

MARK LOCKWOOD PSIAKI 1987 392 p
Avail: Univ. Microfilms Order No. DA8800331

Aircraft control strategies that minimize the hazard of longitudinal flight through microburst wind shear are developed and analyzed, principally using deterministic trajectory optimization and to a lesser extent using classical control. The purpose is to determine the ultimate limits to safe performance in a microburst and develop control strategies that achieve such performance. Several tragic microburst-related accidents have demonstrated the need for improved control strategies. Over 1,100 optimal trajectories were computed for jet transport and general aviation aircraft flying through idealized and actual microbursts. They were generated using a Successive Quadratic Programs trajectory optimization algorithm, which directly handles inequality constraints. Qualitative aspects of the best strategies provide a composite picture of good control in a microburst. Variations of the optimal performance with microburst type, intensity, length scale, and location define safe-performance limits. These studies provide guidelines for design and evaluation of practical microburst-encounter control laws. Controllers should replicate the pitch steering and throttle strategies found in the composite picture of good control. Evaluation should include frequency response analysis and comparison of closed-loop safe-performance limits with optimal limits. Dissert. Abstr.

(Contract NAG3-729)

(NASA-TM-100182; E-3759; NAS 1.15:100182) Avail: NTIS HC A03/MF A01 CSCL 01C

Presented is a computer simulation of a human response pilot model able to execute operational flight maneuvers and vehicle stabilization of a modern high-performance helicopter. Low-order, single-variable, human response mechanisms, integrated to form a multivariable pilot structure, provide a comprehensive operational control over the vehicle. Evaluations of the integrated pilot were performed by direct insertion into a nonlinear, total-force simulation environment provided by NASA Lewis. Comparisons between the integrated pilot structure and single-variable pilot mechanisms are presented. Static and dynamically alterable configurations of the pilot structure are introduced to simulate pilot activities during vehicle maneuvers. These configurations, in conjunction with higher level, decision-making processes, are considered for use where guidance and navigational procedures, operational mode transfers, and resource sharing are required. (Contract NAG3-729)

(NASA-TM-100183; E-3760; NAS 1.15:100183) Avail: NTIS HC A03/MF A01 CSCL 01C

A computer simulation of a human response pilot mechanism within the flight control loop of a high-performance modern helicopter is presented. A human response mechanism, implemented by a low order, linear transfer function, is used in a decoupled single variable configuration that exploits the dominant vehicle characteristics by associating cockpit controls and instrumentation with specific vehicle dynamics. Low order helicopter models obtained from evaluations of the time and frequency domain responses of a nonlinear simulation model, provided by NASA

Lewis Research Center, are presented and considered in the discussion of the pilot development. Pilot responses and reactions to test maneuvers are presented and discussed. Higher level implementation, using the pilot mechanisms, are discussed and considered for their use in a comprehensive control structure. Author

Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

A linear digital simulation of a radio-controlled model helicopter was performed to evaluate the validity of applying frequency domain identification to structural estimation of a complex nonlinear system. The control and telemetry systems, the sensors and the associated signal conditioning developed for the radio-controlled helicopter facility are described. Sine-wave frequency sweeps were applied to each input in turn to excite all the dominant modes of the system, and the time series data were analyzed to obtain the system transfer functions. The closed-loop transfer functions are found by least-squares curve fitting, and the poles and zeros are determined for each case. Comparing these modes with the corresponding elements in the transfer function matrix obtained from the Leverrier algorithm gives results which demonstrate the usefulness of the frequency domain approach in identification. NONLINEAR IDENTIFICATION OF AN AIRCRAFT FOR THE DIRECT CALCULATION OF AN ANTICIPATORY CONTROL [NICHTLINEARE IDENTIFIZIERUNG EINES FLUGZEUGS ZUR DIREKTEN BERECHNUNG EINER VORSTEUERUNG]

M. HAVERLAND and U. LINDEMANN *In* DFVLR, System Identification in Vehicle Dynamics p 363-374 1987 In GERMAN

Avail: NTIS HC A18/MF A01; DFVLR, VB-PL-DO, 90 60 58, 5000 Cologne, Fed. Republic of Germany, 109 Deutsche marks

Using the example of the identification and control of an aircraft, a predictive control method for nonlinear sections is presented. In many cases a linear controller is not sufficient for the control of nonlinear sections, but the combination of a linear controller and predictive control gives better results. The proposed method allows the determination of predictive control coefficients directly from measured quantities. It is shown that the coefficients build up quickly, allowing to follow section parameter variations and providing a high safety level. The method can be used for the identification of nonlinear systems that can be described by a

model that is linear in the coefficients. Dynamic effects can also be taken into account. ESA

THE WALL PRESSURE SIGNATURE MATRIX METHOD FOR SOLID WALL INTERFERENCE CORRECTION OF LOW-SPEED WIND TUNNEL

GUIQING JIANG (China Aerodynamics Research and Development Centre, Sichuan, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 204-212. In Chinese, with abstract in English.

The wall pressure signature matrix method for a low-speed wind tunnel with a solid wall is described. Its starting system of equations is briefly derived. The paper provides the detailed solutions and formulations of corrections. The present method and its procedures have been demonstrated through the numerical simulation tests and the physical model tests, and their check results are presented here. Analyses and calculations are also given for the swept effect, the axial translation acceleration effects, the test section length and the departure of model from tunnel center-line, etc. Author

THE APPLICATION OF COLOUR HELIUM BUBBLE IN THE WIND TUNNEL TEST

DONG ZHAO and MINZHONG TANG (Harbin Aerodynamic Research Institute, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 220-225. In Chinese, with abstract in English. refs

The color helium bubble flow visualization method is a new and unique technique. Flow visualization in the wind tunnel using colored helium bubbles has been achieved at Harbin Aerodynamic Research Institute in March, 1984. Rich and varied paths were obtained. Clear color video tape recording and color photographs were taken. Shortly after, car, coach, building, ship's rudder, fish scale wave surface, slender body, cylinder, parachute and various aircraft models were tested. Author

HELICOPTER FLIGHT SIMULATION - A QUESTION OF FIDELITY

MIKE GROVER (Rediffusion Simulation, Ltd., Crawley, England) ICAO Bulletin (ISSN 0018-8778), vol. 43, May 1988, p. 13-16.

Problems of helicopter flight simulation are examined, presenting developments to make helicopter simulation more effective. Developments in computer-generated imagery, digital processors for controlling and monitoring the simulator environment, rotor modelling, and touch-screen technology are discussed. The integration of available devices to present the full range of operating conditions, the role of the instructor in simulator training, and prospects for future developments in simulator technology are also considered. R.B.

A88-46272

SIMULATION DATA VALIDATION SYSTEM DEVELOPED

J. SHLIEN (CAE Electronics, Ltd., Montreal, Canada) ICAO Bulletin (ISSN 0018-8778), vol. 43, May 1988, p. 17-19.

An automated system designed to rapidly analyze digital simulation checkout data is presented. Previous methods for checking airplane manufacturer's validation data against simulation-model response are discussed. Capabilities of the automated system include interaction between various utilities, a

master data file of pilot input and resultant aircraft response, a manual means to generate the digital data base of the aircraft plots if magnetic tapes are not provided by the manufacturer, and header information to identify each static and dynamic test. R.B.

A88-46273

AIRBUS TRAINING FACILITY COMBINES FLIGHT SIMULATION WITH COMPUTER-BASED INSTRUCTION

HELENE CHARMENSAT (Aeroformation, Toulouse, France) ICAO Bulletin (ISSN 0018-8778), vol. 43, May 1988, p. 20, 21.

An airbus training facility is examined, describing a computer-based instruction and flight simulators. The instructional system includes a microcomputer connected to a video disk reader and monitor. The program and simulator are integrated and allow the student to check the results of an action immediately. The facility equipment includes cockpit system simulators for flight crew training, a maintenance simulator, and an emergency evacuation trainer for the instruction of maintenance personnel and flight attendants. R.B.

TEST METHODS IN HYPERSONICS [MOYENS D'ESSAIS EN HYPERSONIQUE]

J. P. CHEVALLIER (ONERA, Chatillon-sous-Bagneux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 55 p. In French. refs (AAAF PAPER NT-87-09)

The performance of various hypersonic test methods are compared with respect to flow velocity, volumetric mass, temperature, and duration. The elementary shock tube is limited in Mach number, and it is shown how the Mach number can be increased by direct steady expansion, how flow duration can be increased, and how the radiation barrier can be extended by unsteady effects. The principle and performance of the light-gas guns used in hyperballistic firing tunnels are considered. It is noted that the F4 short-trajectory wind tunnel has a high level of performance, has a long flow duration, and allows the use of models of the order of 40 cm. R.R.

A88-46427

THE ACQUISITION AND USE OF FLIGHT SIMULATION TECHNOLOGY IN AVIATION TRAINING; PROCEEDINGS OF THE INTERNATIONAL CONFERENCE, LONDON, ENGLAND, APR. 27-29, 1987. VOLUMES 1 & 2

Conference sponsored by the Royal Aeronautical Society. London, Royal Aeronautical Society, 1987, p. Vol. 1, 186 p.; vol. 2, 248 p. For individual items see A88-46428 to A88-46445.

The present conference discusses the military perspective on future flight simulation, UK Ministry of Defense procurement of simulators and trainers for aircraft, acquisition management considerations for simulator procurement, and funding sources for simulator financing. Also discussed are the acquisition of training systems by the USAF, the integration of low cost trainers in a commercial pilots' license syllabus, integrated ground training for an advanced turboprop aircraft, and a comparison of military and civilian simulator procurement and program-management practices. Consideration is given to the CAA approach to simulator approval, regional-airline requirements for training and training devices, the integration of avionics in simulators, total training-system management, and the use of knowledge-based techniques in the formulation and bidding of simulator projects. O.C.

ACCEPTANCE PROCEDURES TO IMPROVE THE HANDLING FIDELITY OF MILITARY FLIGHT SIMULATORS

A. D. WHITE (Royal Aircraft Establishment, Bedford, England) IN: The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 269-281. refs

A number of in-service UK flight training simulators have recently been the subject of criticism in connection with handling fidelity. As a result of these criticisms, a review of Ministry of Defence acceptance procedures is underway. This paper examines some of the problems that have been experienced, summarizes the proposed new Acceptance Test Schedule items for dynamic handling qualities, and considers some of the implications for simulator specifications and data sources. B.J.

FAA'S ADVANCED SIMULATION PLAN INFLUENCE ON SIMULATOR DESIGN AND DATA ACQUISITION

JOHN E. HOPE (Boeing Commercial Airplane Co., Seattle, WA) IN: The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 317-324.

The impact of the Advanced Simulation Plan on simulator design and data acquisition is discussed from a Boeing perspective. It is noted that the introduction and maturing of the Plan has provided a uniform set of achievable standards which would not otherwise have been economically feasible. The generation of flight test data for simulator use has required increased emphasis on controlled test conditions, data resolution, and timing accuracy. Correspondingly, simulators have required the development of hydrostatic digital control loading systems and powerful instructor stations able to perform FAA Approval Test Guide testing speedily, accurately, and conveniently. Growth in simulator computing demand due to greatly increased data package demand has led to increasing interest in computing configurations able to provide expansion flexibility at minimum cost. B.J.

A88-46441

THE INTEGRATION OF AIRPLANE AVIONICS EQUIPMENT IN FLIGHT SIMULATORS

W. D. HASS (Deutsche Lufthansa AG, Frankfurt am Main, Federal Republic of Germany) IN: The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volume 2. London, Royal Aeronautical Society, 1987, p. 325-332.

The problems new-generation digital avionics equipment presents to flight simulators are examined. Possible solutions for the integration of this equipment is considered, including the simulation of the avionics functions by software running in the simulator host computer and the 'simulation' of avionics functions using modified aircraft computers. The creation of an industry standard is considered along with the implementation of ARINC 610 recommendations. B.J.

A88-46977

AEROSPACE SYSTEM SIMULATION AT SANDIA NATIONAL LABORATORIES

ALFRED C. WATTS (Sandia National Laboratories, Albuquerque, NM) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 777-781.

The development of navigation, guidance and control systems for flight test vehicles associated with advanced weapons systems is discussed. Computing facilities used in all-digital simulations, real-time digital simulations and hybrid, hardware-in-the-loop

simulations using various elements of guidance hardware and a three-axis motion simulator are examined. The methodology for the validation of flight software and the performance validation for guidance and control hardware is presented. R.B.

FOUR URBAN HELIPORT CASE STUDIES Final Report

DEBORAH PEISEN and JACK THOMPSON Mar. 1988 57 p (Contract DTFA01-87-C-00014) (DOT/FAA/PM-87/32; DOT/FAA/PP-88/2; REPT-5542-6A3) Avail: NTIS HC A04/MF A01

State and city governments generally realize that continued vitality depends on a steady expansion of industry and services as a function of planned growth. The helicopter is a proven catalyst for enhancement of those desired growth patterns. Case histories are developed for public use heliports built in the Central Business District of several major cities. Within each case history, common denominators are identified that are useful for planners in assessing the vitality of heliport proposals in cities that exhibit similar demographic characteristics. Each case study provides a general background as a setting and an inventory of pertinent heliport data: including location, cost, history, funding and revenue sources, operational characteristics, etc.; it addresses social concerns such as the local industrial base, neighboring land uses and zoning; and the public and governmental attitudes toward the heliport. Histories of four heliports are presented, specifically: the Bank-Whitmore Heliport (aka Nashua Street Heliport) in Boston, the Downtown Heliport in Indianapolis; the Downtown Heliport in New Orleans; and the Western and Southern Heliport in Cincinnati. WIND TUNNEL WALL INTERFERENCE (JANUARY 1980 - MAY 1988): A SELECTED, ANNOTATED BIBLIOGRAPHY

MARIE H. TUTTLE (Vigyan Research Associates, Inc., Hampton, Va.) and KAREN L. COLE Aug. 1988 88 p (NASA-TM-4061; L-16465; NAS 1.15:4061) Avail: NTIS HC A05/MF A01 CSCL 14B

This selected bibliography lists 423 entries on the subject of wall interference during testing in wind tunnels. It is the third in a series of bibliographies on the subject. The first, NASA TM-87639, August 1986, is concerned with the reduction of wall interference by the use of adaptive walls. The second, NASA TP-89066, December 1986, is on wall interference in V/STOL and high lift testing. This, the third in the series, covers the wall interference literature published during the period January 1980 through May 1988, generally excluding those topics covered in the first two parts. FLIGHT SIMULATOR: FIELD OF VIEW UTILIZED IN PERFORMING TACTICAL MANEUVERS Final Report, Jan. 1983 - Dec. 1984

LINDA A. WIEKHORST and FRANK T. VACCARO Apr. 1988 26 p Supersedes AFHRL-TP-86-29 (AD-A192412; AFHRL-TP-87-50; AFHRL-TP-86-29) Avail: NTIS HC A03/MF A01 CSCL 05F

This paper documents the field of view (FOV) utilized by experienced fighter pilots when performing specified portions of air-to-air and air-to-ground maneuvers. The FOV measurements were taken in the Simulator for Air-to-Air Combat (SAAC) and the Advanced Simulator for Pilot Training (ASPT). During the air-to-ground data collection, measurements were also taken while subjects performed the same tasks with a limited field of view (LFOV). Results of the data collected indicate that the FOV utilized varied widely between air-to-air and air-to-ground maneuvers. In nearly all cases, the FOV utilized for air-to-air maneuvers was symmetrical and that for air-to-ground maneuvers was skewed to one side. When air-to-ground tasks were performed in an LFOV, significantly poorer bomb scores and significantly higher release

altitudes were found when compared to wide-FOV performance. A noticeable performance change in the LFOV condition was a tendency of the pilots to turn tighter into the target. The true effect of this change in flight path still needs to be investigated. Specifying one optimal LFOV for all maneuvers to be performed or trained in an operational flight simulator would be difficult if both cost and performance were to be considered. The variability of the FOV leads to the conclusion that placement of LFOV will be an important decision when considering what tasks will be performed. Full training implications cannot be determined until further transfer-of-training experiments are completed. GRA

ANALYSIS OF GAS TURBINE TEST CELL NUMBER 1, LEMOORE NAVAL AIR STATION, CALIFORNIA M.S. Thesis
 KEVIN D. SMITH Dec. 1987 136 p
 (AD-A192870) Avail: NTIS HC A07/MF A01 CSCL 01C

A three-dimensional numerical analysis of Gas Turbine Test Cell 1 at Lemoore Naval Air Station, California, is given. The Parabolic, Hyperbolic, or Elliptic Numerical Integration Code (PHOENICS) is used to determine the steady-state aerothermal characteristics within the test cell during the full power run-up of a GE F404 gas turbine engine (afterburner in operation). The method in which PHOENICS arrives at a solution is discussed as well as how the code was applied to this problem. The solution of the problem is presented in tabular form and the results are discussed. Recommendations for the future application of PHOENICS to this project are given. GRA

TITANIUM ALLOYS IN HELICOPTER ROTOR HEAD DESIGNS
 D. P. DAVIES (Westland Helicopters, Ltd., Yeovil, England) Metals and Materials (ISSN 0266-7185), vol. 4, July 1988, p. 417-422. Research supported by the Ministry of Defence Procurement Executive. refs

Within current design concept constraints, three methods for the improvement of titanium alloy helicopter rotor head fatigue, toughness, and mechanical property performance are considered: (1) the use of beta-forging processes and beta heat treatments; (2) solution-treated and overaged (thermal treatment) processing of the alpha-beta processed material just before the beta transus; and (3) the evaluation and optimization of high strength alpha-beta titanium alloys, or metastable beta titanium alloys. Useful mechanical performance improvements are found to be obtainable by changing from an annealed form of the Ti-6Al-4V alloy to a solution-treated and overaged one. O.C.

A88-46425

MATERIALS TRENDS IN MILITARY AIRFRAMES
 C. A. STUBBINGTON Metals and Materials (ISSN 0266-7185), vol. 4, July 1988, p. 424-431. refs

While future combat aircraft will incorporate increasing percentages of CFRP composites in their primary structures, the predominant material is presently projected to remain the family of aircraft aluminum alloys. It is also expected that the successful development of Al-Li alloys will reinforce the dominance of aluminum alloys among airframe materials. Evaluations are also presented of military airframe incorporation trends for SPF/DB aluminum and titanium alloy structures, undercarriage-component steels, high corrosion-resistance Mg casting alloys, and such advanced airframe composite systems, PES and PEEK

thermoplastic matrix resins, P/M Al-Fe-Ce alloys, rapid solidification processes for refractory alloys, metal-matrix composites, and the Arrall aluminum/kevlar-epoxy hybrid laminate. O.C.

COMPUTERIZED LIFE AND RELIABILITY MODELLING FOR TURBOPROP TRANSMISSIONS

M. SAVAGE (Akron, University, OH), K. C. RADIL, D. G. LEWICKI (U.S. Army, Propulsion Directorate, Cleveland, OH), and J. J. COY (NASA, Lewis Research Center, Cleveland, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference and Exhibit, 24th, Boston, MA, July 11-13, 1988. 11 p. Previously announced in STAR as N88-23220. refs (AIAA PAPER 88-2979)

A generalized life and reliability model is presented for parallel shaft geared prop-fan and turboprop aircraft transmissions. The transmission life and reliability model is a combination of the individual reliability models for all the bearings and gears in the main load paths. The bearing and gear reliability models are based on classical fatigue theory and the two parameter Weibull failure distribution. A computer program was developed to calculate the transmission life and reliability. The program is modular. In its present form, the program can analyze five different transmission arrangements. However, the program can be modified easily to include additional transmission arrangements. An example is included which compares the life of a compound two-stage transmission with the life of a split-torque, parallel compound two-stage transmission as calculated by the computer program. SUBSONIC AND SUPERSONIC COMBUSTION USING NONAXISYMMETRIC INJECTORS

E. GUTMARK, K. C. SCHADOW, and K. J. WILSON (U.S. Navy, Naval Weapons Center, China Lake, CA) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference and Exhibit, 24th, Boston, MA, July 11-13, 1988. 7 p. refs (AIAA PAPER 88-3141)

Nonreacting and combustion tests were performed for subsonic, sonic, and supersonic conditions using noncircular injectors in a gas generator combustor. The noncircular injectors, including square, equilateral, and isosceles triangular nozzles, were compared to a circular ejector. The flow field of the jets was mapped with hot wire anemometry and visualized using spark Schlieren photography. The combustion characteristics were visualized by high speed photography and thermal imaging; the temperature distribution was measured by a rake of thermocouples. The large scale mixing at the flat sides with the fine scale mixing at the vertices is beneficial for combustion. Author

A CRYSTALLOGRAPHIC MODEL FOR NICKEL BASE SINGLE CRYSTAL ALLOYS

L. T. DAME (International TechneGroup, Inc., Milford, OH) and D. C. STOUFFER (Cincinnati, University, OH) ASME, Transactions, Journal of Applied Mechanics (ISSN 0021-8936), vol. 55, June 1988, p. 325-331. refs (Contract NAG3-511)

The purpose of this research is to develop a tool for the mechanical analysis of nickel-base single-crystal superalloys, specifically Rene N4, used in gas turbine engine components. This objective is achieved by developing a rate-dependent anisotropic constitutive model and implementing it in a nonlinear three-dimensional finite-element code. The constitutive model is developed from metallurgical concepts utilizing a crystallographic approach. An extension of Schmid's law is combined with the Bodner-Partom equations to model the inelastic tension/compression asymmetry and orientation-dependence in octohedral slip. Schmid's law is used to approximate the inelastic response of the material in cube slip. The constitutive equations model the tensile behavior, creep response and strain-rate sensitivity of the single-crystal superalloys. Methods for deriving the material constants from standard tests are also discussed.

11 CHEMISTRY AND MATERIALS

The model is implemented in a finite-element code, and the computed and experimental results are compared for several orientations and loading conditions. Author

ELECTRICALLY CONDUCTING PLASTICS - NEW MATERIALS FROM AEROSPACE RESEARCH

TEH S. KUAN and RANDY CAMERON (Lockheed Aeronautical Systems Co., Burbank, CA) Lockheed Horizons (ISSN 0459-6773), May 1988, p. 48-56.

An account is given of the development status and range of currently available compositions and performance properties of electrically conducting plastics. The first of these, the serendipitously discovered polyacetylene, was useful as a battery electrode in rechargeable cells but was found to be dangerously unstable in air. Attention is given to novel proprietary conducting plastic compositions that are stable in air or water at all conductivity levels (of which the highest are fully comparable to those of metals) and which are stable in mutual contact; this latter property allows the production of circuit boards. The new plastics are noted to be produced in conducting or semiconducting form for less than \$1.00/lb (by contrast to semiconducting silicon, which costs about \$100,000.00/lb), and can be blended with structural plastics to form high-strength conductive materials applicable to aircraft construction. O.C.

A88-48455

CERAMICS FIRE THE FUTURE

CHRIS DREWER Flight International (ISSN 0015-3710), vol. 134, July 9, 1988, p. 26, 27, 30, 31.

Turbine blade superalloys currently operating at temperatures of 80 percent of their melting point require the bleeding of substantial amounts of compressor air for cooling, leading to a substantial efficiency penalty. As military gas turbine thrust-weight ratios surpass values of 10, the use of structural ceramic materials for turbine blade and stator vane construction is presently noted to become imperative, allowing higher turbine inlet temperatures to be reached without resort to air cooling. Candidate materials are of both carbon/carbon composite and ceramic-matrix composite types; the matrix ceramic compositions under intensive development are silicon nitride and silicon carbide. O.C.

A88-49202

CYCLIC OXIDATION OF ALUMINIZED TI-14AL-24NB ALLOY

J. SUBRAHMANYAM (Defence Metallurgical Research Laboratory, Hyderabad, India) Journal of Materials Science (ISSN 0022-2461), vol. 23, June 1988, p. 1906-1910. refs

Titanium aluminides are considered as replacements for superalloys in applications in gas turbine engines because of their outstanding properties. Ti3Al has a superior creep strength up to 815 C, but has poor oxidation resistance above 650 C. Two approaches can be followed to improve the oxidation resistance of Ti3Al above 650 C. One is alloying and the other obtaining a protective surface coating. Niobium was found to improve the oxidation resistance, when added as an alloying element. Recent investigations showed that a TiAl3 surface layer considerably improves the oxidation resistance of titanium. In the present work, a TiAl3 layer was obtained on a Ti-14Al-24Nb (wt pct) alloy using a pack aluminizing process. The cyclic oxidation behavior of aluminized and uncoated samples was evaluated. FEASIBILITY OF PRODUCING JET FUEL FROM GPGP (GREAT PLAINS GASIFICATION PLANT) BY-PRODUCTS Quarterly Report, 17 Aug. - 16 Nov. 1987

W. G. WILLSON, C. L. KNUDSON, and J. R. RINDT 1987 48 p (Contract DE-AC22-87PC-90016) (DE88-010233; DOE/PC-90016/T2) Avail: NTIS HC A04/MF A01

The technical and economic feasibility of producing aviation turbine fuel from by-product streams of the Great Plains Gasification Plant (GPGP) in Beulah, ND, is assessed. A secondary goal of the project is to assess the conversion of the by-product streams into a new, higher-density aviation fuel. GPGP currently produces 150 MM SCFD of synthetic natural gas from 16,000 tpd of North Dakota lignite. In addition the plant generates three liquid hydrocarbon streams : 730 barrels per day (BPD) naphtha, 880 BPD phenols, and 3200 BPD tar/oil. Work at the University of North Dakota Energy and Mineral Research Center has focused on two tasks performed in support of these objectives. The first task consisted of a detailed analysis of the by-product streams under consideration. Of the three streams, the tar oil stream is the largest and shows the most promise for upgrading to aviation turbine fuel. Detailed characterization data on the tar/oil were presented in the previous quarterly. A true boiling point (TBP) distillation was performed on the GPGP phenol stream, yielding nine fractions which were characterized using NMR, GC, and GC/MS. The second task involves an engineering evaluation of by-product upgrading. Two methods are under investigation for the production of aviation fuel: single-stage, in which heteroatom removal and hydrogenation are accomplished in a single step, and two-stage, in which the heteroatoms are removed in the first-stage, and hydrogenation occurs during the second stage. Hydrogenation was improved by increased pressure and temperature, although the measured effect on aromatic content awaits further analyses. Data indicates that, to achieve complete nitrogen and sulfur removal, the preferred operating conditions are temperatures of 610 to 645 F and pressures of at least 2000 psig. DOE

N88-26495*# Jet Propulsion Lab., California Inst. of Tech., Pasadena.

ANTIMISTING KEROSENE: LOW TEMPERATURE DEGRADATION AND BLENDING Final Report, Jun. 1983 - Aug. 1985

A. YAVROUIAN, P. PARIKH, and V. SAROHIA Jun. 1988 57 p (Contract NAS7-100; DTFA03-80-A-00215) (NASA-CR-182725; JPL-PUB-D-5518; NAS 1.26:182725; DOT/FAA/CT-86/3) Avail: NTIS HC A04/MF A01 CSCL 21D

The inline filtration characteristics of freshly blended and degraded antimisting fuels (AMK) at low temperature are examined. A needle valve degrader was modified to include partial recirculation of degraded fuel and heat addition in the bypass loop. A pressure drop across the needle valve of up to 4,000 psi was used. The pressure drop across a 325 mesh filter screen placed inline with the degrader and directly downstream of the needle valve was measured as a function of time for different values of pressure drop across the needle valve. A volume flux of 1 gpm/sq in was employed based on the frontal area of the screen. It was found that, at ambient temperatures, freshly blended AMK fuel could be degraded using a single pass degradation at 4,000 psi pressure drop across the needle valve to give acceptable filterability performance. At fuel temperatures below -20 C, degradation becomes increasingly difficult and a single pass technique results in unacceptable filtration performance. Recirculation of a fraction of the degraded fuel and heat addition in the bypass loop improved low temperature degradation performance. The problem is addressed of blending the AMK additive with Jet A at various base fuel temperatures. Author

THE HIGHLY ACCURATE CONVECTIVE DIFFERENCE SCHEMES

SHUQUAN LU (Nanjing Aeronautical Institute, People's Republic of China) Acta Aerodynamica Sinica (ISSN 0258-1825), vol. 6, June 1988, p. 182-189. In Chinese, with abstract in English. refs

For the generalized convective difference schemes, two methods, namely the method of analyzing the truncated error and the method of estimating the error after the event, are applied to derive the optimum a values in order to make the errors minimum. It differs from the other schemes in that one can derive them from the convection-diffusion equation itself. Many results show that the method of analyzing the truncated error is highly accurate. The errors of the method of estimating the error after the event are smaller or much smaller than the errors of the ordinary schemes, except in very few special cases. However, for some complex problems, there may be some difficulty in applying the first method, but none in applying the second one. Author

SOME THOUGHTS ON POWER-AUGMENTED-RAM WING-IN-GROUND (PAR-WIG) EFFECT VEHICLE

SHIGENORI ANDO (Nagoya University, Japan) Japan Society for Aeronautical and Space Sciences, Transactions (ISSN 0549-3811), vol. 31, May 1988, p. 29-47. refs

The PAR (Power-Augmented-Ram) WIG (Wing-in-Ground) effect vehicle is promising as an overwater commuter transport vehicle. Three important requirements, PAR effect, ability of off-ground effect flight, and ability of automatic IGE (in-ground effect) flight, are described. Many useful materials for designing WIG are

presented. New concepts are proposed, which contain some new devices. Ability of 'stick-free' IGE flight is especially desirable, hence the phugoid mode should be suppressed sufficiently. Author

ASYMPTOTIC THEORY OF SEPARATED FLOWS [ASIMPTOTICHESKAIA TEORIJA OTRYVNYKH TECHENII]

VLADIMIR VASIL'EVICH SYCHEV, ANATOLII IVANOVICH RUBAN, VIKTOR VLADIMIROVICH SYCHEV, and GEORGII L'VOVICH KOROLEV Moscow, Izdatel'stvo Nauka, 1987, 256 p. In Russian. refs

Results of theoretical studies of separation flows of an incompressible fluid at large Reynolds numbers using asymptotic methods are examined. Particular attention is given to problems of self-induced separation in stationary and nonstationary flows, theory of local separations at the leading and trailing edges of thin airfoils, and investigations of the global field structure of flows in the wake of blunt bodies. Numerical methods for solving problems of the interaction between a boundary layer and a potential flow are discussed. V.L.

SPEECH RECOGNITION INTEGRATED WITH ATC SIMULATION

ARTHUR GERSTENFELD (UFA, Inc., Newton; Worcester Polytechnic Institute, MA) ICAO Bulletin (ISSN 0018-8778), vol. 43, May 1988, p. 22, 23.

A system simulator with the capability of speech recognition and speech synthesis for air traffic controller training is presented. The computer synthesizes the voices of both the pilot responses and the instructor. The simulator recognizes the speech of a single speaker and moves the aircraft on the radar display as the trainee gives directions and clearances orally. The speaker must train the system by repeating the words in the system vocabulary several times allowing for a reliability of recognition above 90 percent. The systems can be integrated making it possible for one instructor to train up to six students. R.B.

INFLUENCES OF ENVIRONMENT AND STRESS HISTORY ON THE COMPOSITE PATCH REPAIR OF CRACKED METALLIC STRUCTURES

P. HUCULAK, M. D. RAIZENNE, and R. F. SCOTT (National Research Council of Canada, Ottawa) Canadian Aeronautics and Space Journal (ISSN 0008-2821), vol. 34, June 1988, p. 85-91. Research supported by the Defence Research Establishment Pacific. refs

Test data related to the development of procedures for bonded composite material-patch repairs of damaged metallic structures are presented. Attention is given to patched preconditioned center-cracked tension specimens subjected to constant-amplitude loading and 100 percent relative humidity at 100 C. Cycling the load in these conditions resulted in significantly higher crack growth rates; these rates are compared to those from laboratory air tests

12 ENGINEERING

and those from unpatched specimens loaded at 100 C. Fatigue crack growth rates obtained in patched and unpatched specimens loaded according to the sequence in the Fighter Aircraft Loading Standard for Fatigue Evaluation spectrum are presented, together with adhesive shear moduli yielded by three different techniques.

METHODS FOR MEASURING CONVECTION FLUX IN THE R2 AND R3 WIND TUNNELS AT CHALAIS-MEUDON - CURRENT IMPLEMENTATION AND FUTURE DEVELOPMENTS [METHODES DE MESURE DE FLUX DE CONVECTION DANS LES SOUFFLERIES R2 ET R3 DE CHALAIS-MEUDON - MISE EN OEUVRE ACTUELLE ET DEVELOPPEMENTS ENVISAGES]

H. CONSIGNY, V. MENTRE, and A. BETREMIEUX (ONERA, Chatillon-sous-Bagneux, France) Colloque d'Aerodynamique Appliquee, 24th, Poitiers, France, Oct. 26-28, 1987. 25 p. In French. refs

(AAAF PAPER NT-87-11)

The principles, advantages, and disadvantages of the three convection-flux measurement methods employed in the R2 and R3 gust wind tunnels at Chalais-Meudon are discussed. While the calorimetric method has the advantages of high precision and the use of thermocouples which do not require calibration, it is not suitable for studying unsteady phenomena or thin surfaces. While offering flexibility, low cost, and great detail, the thermosensitive painting visualization method does not permit the visualization of certain zones and cannot measure exchange coefficients which are less than about 0.005 W/sq cm per K. The surface-temperature method, which makes possible the study of extremely fast phenomena, is illustrated with examples such as the measurement of the stagnation enthalpy in a plasma-generating wind tunnel.

FATIGUE STRENGTH CALCULATION

A. BUCH (Technion - Israel Institute of Technology, Haifa) Aedermannsdorf, Switzerland, Trans Tech Publications (Materials Science Surveys, No. 6), 1988, 473 p. refs

Calculation of the fatigue strength of a structural component is much more difficult than that of its static strength, due to the prominence of such factors as notch effects, size effects, and surface quality effects. The present work undertakes a general treatment of fatigue, and gives attention to the fatigue limit of unnotched specimens, the fatigue limit of notched specimens, the construction of idealized S-N curves, fatigue damage accumulation, special surface treatments, and aircraft fatigue. Also presented are extensive fatigue data sheets.

THE TRICK WITH LIGHT-EMITTING DIODES - HOW TO RECOGNIZE A WING'S AERODYNAMIC QUALITY AT A GLANCE

New-Tech News, no. 2, 1988, p. 12-15.

LEDs have been integrated with advanced computational resources to investigate model wing and model engine wake flows. This system follows the pendular motion of a pressure sensor immersed in the flow to be studied by means of a diode, thereby rendering the shape and size of the turbulence visible in terms of colored light. The vortical flow structures thus visualized have proven useful in discerning the disturbance of wing flows by air circulating around wingtips, around flap and aileron edges, and around wing fairings and engine nacelles.

QUANTITATIVE CHARACTERIZATION OF IMPACT DAMAGE IN COMPOSITE MATERIALS - A COMPARISON OF COMPUTERIZED VIBROTHERMOGRAPHY AND X-RAY TOMOGRAPHY

P. POTET (Compiegne, Universite de Technologie, France), C. BATHIAS, and B. DEGRIGNY Materials Evaluation (ISSN 0025-5327), vol. 46, July 1988, p. 1050, 1051, 1053, 1054.

Research supported by the Service Technique des Constructions et Armes Navales. refs

X-ray computerized tomography (CT) and computerized vibrothermography for the detection of impact damage in composite materials are compared, using CT as a reference method for the sake of comparison. A computer program was developed to compute heat-source maps from the experimental temperature fields. Damages indicated by the heat-source map corresponded to those detected by CT on the impacted side of the specimen. Damage located in the surface ply on the opposite impacted side was not detected by CT. It is found that vibrothermography accurately locates damage, but cannot determine its size and shape. Because of the attenuation of heat through the thickness, vibrothermography can only detect damage in the first plies of the specimen.

CALCULATION OF SUPERSONIC FLOW PAST A CYLINDRICAL SHELL WITH ALLOWANCE FOR AEROELASTIC DEFORMATION [RASCHET SVERKHZVUKOVOGO OBTEKANIIA TSILINDRICHESKOI OBOLOCHKI S UCHETOM AEROUPRUGOI DEFORMATSII]

N. N. BELIAEV and V. K. KHRUSHCH (Dnepropetrovskii Gosudarstvennyi Universitet, Dnepropetrovsk, Ukrainian SSR) *Gidromekhanika* (ISSN 0367-4088), no. 57, 1988, p. 16-19. In Russian.

The problem considered here is the coupled stationary aeroelasticity problem of transverse supersonic flow of a viscous ideal gas past a cylindrical shell. In particular, the effect of shell deformation on the drag is analyzed. Displacements in the shell are determined for a pressure distribution corresponding to a rigid nondeformed cylinder and for the coupled problem where gas flow and shell deformation are calculated simultaneously. A numerical algorithm for solving the problem is developed which uses the method of flows to solve the Euler equations and the finite difference method to solve the Karman equations.

EVALUATION OF CRACK GROWTH MODELS FOR ELEVATED-TEMPERATURE FATIGUE

GEORGE K. HARITOS (USAF, Institute of Technology, Wright-Patterson AFB, OH), THEODORE NICHOLAS (USAF, Materials Laboratory, Wright-Patterson AFB, OH), and GERALD O. PAINTER (USAF, Ballistic Missile Office, Norton AFB, CA) IN: *Fracture mechanics*. Philadelphia, PA, American Society for Testing and Materials, 1988, p. 206-220. refs (Contract AF PROJECT 2302P1)

To date, only two models have been proposed for predicting crack growth rates in aircraft engine materials under typical operating conditions. Moreover, modeling to date has been performed on materials which exhibit limited amounts of time-dependent behavior. This investigation evaluates the predictive and interpolative capabilities of these models when applied to IN718 at 649 C. At this temperature, this material exhibits significant time-dependent behavior. Experimental data were generated and

used to assess the predictive and interpolative characteristics of each model. These data covered variations in frequency, stress ratio, and hold time. Values for the coefficients in the functional relationships between the constants and the test variables were obtained for the hyperbolic sine equation model. Similar functional relationships were incorporated into the modified sigmoidal equation model. Several important conclusions were drawn about the capabilities of these two models to predict crack-growth rates in turbine-engine materials at elevated temperature. Author

A88-47004**FATIGUE CRACK GROWTH AT ROOT RADII IN SHEETS WITH VARIABLE THICKNESS**

MEHAN M. RATWANI, HAN-PIN KAN, and SHENG-MING HSU (Northrop Corp., Aircraft Div., Hawthorne, CA) IN: Fracture mechanics. Philadelphia, PA, American Society for Testing and Materials, 1988, p. 765-780. Research sponsored by Northrop Independent Research and Development Program. refs

Fatigue crack growth data have been obtained for cracks at root radii in sheets with variable thickness. These test data were obtained under constant-amplitude as well as spectrum loading. Analytical stress-intensity factors were developed using mathematical techniques. The Mode I stress-intensity factors were approximately 10 percent lower than that of a plate with uniform thickness. Crack growth predictions for the test specimens were made using the analytical stress-intensity factors and a crack growth equation for a skin with uniform thickness. A good correlation is shown between observed and predicted crack growth behavior. Author

A. GEDDAM (ISRO, New Bombay, India) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 125-135. refs

Manufacturing materials, requirements, and methods for inertial device components are described. The desired material properties and the best materials to be utilized in particular components are mentioned. Manufacturing methods for gyro wheel components, gyro gimbal-float structure, flexure elements, and inertial platform elements are examined. C.D.

A88-47043**DYNAMICS AND CONTROL OF A GYROSCOPIC FORCE MEASURING SYSTEM**

P. K. SINHA (Keele, University, England) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 137-148. refs

This paper presents the first stage of a design and construction project for the development of a low-cost gyroscopic force measuring (GFM) system. Despite the widespread use of gyroscopes in inertial guidance and stabilization systems, relatively little is known about the dynamic behavior of a two-axis gyroscope as a force sensing device. The paper develops a linear mathematical model of a GFM system with particular reference to assessing the structural properties as well as the control problems. Author

A88-47047**A REVIEW OF THE MECHANICAL DESIGN AND DEVELOPMENT OF A HIGH PERFORMANCE ACCELEROMETER**

T. G. SMITHSON (Ferranti Instrumentation, Ltd., Bracknell, England) IN: International Conference on the Mechanical Technology of Inertial Devices, Newcastle-upon-Tyne, England, Apr. 7-9, 1987, Proceedings. London, Mechanical Engineering Publications, Ltd., 1987, p. 175-190.

The factors governing the performance of a pendulous force feedback accelerometer when it is subjected to the environment found in a strapdown inertial navigation system utilizing dithered ring laser gyroscopes is discussed, together with a proposed specification aimed at achieving the desired results. The design philosophy derived to develop an instrument for use in the highest accuracy systems is outlined. Author

A88-47566**EFFECTIVE USE OF BUFFER GAS SLEEVE-TYPE SEALS IN CENTRIFUGAL COMPRESSORS**

YU-MING WANG and ZHEN-QING CHEN (Tianjin Mechanical Seal Research Institute, People's Republic of China) (STLE and ASME, Tribology Conference, San Antonio, TX, Oct. 5-8, 1987) STLE Tribology Transactions (ISSN 0569-8197), vol. 31, July 1988, p. 376-381.

In this paper, the behavior of a buffer gas sleeve-type seal is explained on the basis of statistical physics. This is related to measurements made in an actual application with normal runout and vibration. Optimum utilization of this kind of seal in centrifugal compressor is discussed. It is concluded that a straight sleeve seal can be made more effective and efficient than the labyrinth seals that are usually used in such buffer seal applications. Author

A88-47669**POWER RADIATED BY AN INFINITE PLATE SUBJECT TO FLUID LOADING AND LINE DRIVE**

D. INNES and D. G. CRIGHTON (Cambridge University, England) Journal of Sound and Vibration (ISSN 0022-460X), vol. 123, June 22, 1988, p. 437-450. refs
(Contract N00014-81-G-0010; N00014-86-G-0066)

Fluid-loading effects on the acoustic and vibration response of a thin elastic plate can be specified by a phase Mach number or frequency parameter $M = k(0)/k(p)$ and an intrinsic fluid-loading parameter (ϵ). In this paper asymptotic expressions are given for the acoustic power radiated by a thin plate under line force drive, covering the entire frequency range $M = 0$ -infinity in the limit ϵ approaches zero. These expressions reflect the balance of physical mechanisms in each of four principal frequency ranges and, for the case of steel plates with water loading, are shown to agree extremely well with previously published numerical evaluations of the acoustic power. A88-47686**ANALYTIC AND ANALOGUE TECHNIQUES FOR DETERMINING POTENTIAL DISTRIBUTIONS AROUND ANGLED CRACKS**

D. A. GREEN, J. M. KENDALL, and J. F. KNOTT (Cambridge University, England) International Journal of Fracture (ISSN 0376-9429), vol. 37, May 1988, p. R3-R12. Research supported by SERC and British Railways. refs

Potential distributions around short cracks lying at an angle to the test-piece surface have been determined using two different methods. First, an analytical solution for a semiinfinite body containing an edge crack inclined at any angle to the surface is obtained using conformal mapping. Then, an analogue technique employing graphitized paper is used to represent a uniform conductor, enabling the effect of finite specimen boundaries to be represented and a 'zig-zag' crack profile to be treated. R.R.

A88-47873**DECAY OF SPANWISE WAVY INHOMOGENEITIES IN A THREE-DIMENSIONAL TURBULENT BOUNDARY LAYER OVER AN 'INFINITE' SWEEPED CONCAVE WING**

V. BASKARAN and P. BRADSHAW (Imperial College of Science and Technology, London, England) Experiments in Fluids (ISSN 0723-4864), vol. 6, no. 7, 1988, p. 487-492. Research supported by the Ministry of Defence Procurement Executive. refs

Measurements have been made in a three-dimensional turbulent boundary layer over a concave surface, whose generators were swept at 35 deg (simulating an 'infinite' swept wing). The results show that the quasi-periodic spanwise variations of skin friction,

12 ENGINEERING

reported in two-dimensional concave wall turbulent boundary layers, decay in the presence of a cross flow. Skin friction surveys in a companion experiment with an 'infinite' swept concave surface of variable sweep show that there exists a critical sweep angle below which the disturbances grow, and above which they decay.

A88-47993*# University of Southern California, Los Angeles. **FLUID DYNAMIC MODELING AND NUMERICAL SIMULATION OF LOW-DENSITY HYPERSONIC FLOW**

H. K. CHENG and ERIC Y. WONG (Southern California, University, Los Angeles, CA) AIAA, Thermophysics, Plasmadynamics and Lasers Conference, San Antonio, TX, June 27-29, 1988. 16 p. refs

(Contract NAGW-1061; AF-AFOSR-88-0014)

(AIAA PAPER 88-2731)

The concept of a viscous shock-layer and several related versions of continuum theories/methods are examined for their adequacy as a viable framework to study flow physics and aerothermodynamics of relevance to sustained hypersonic flights. Considering the flat plate at angle of attack, or the wedge, as a generic example for the major aerodynamic component of a hypersonic vehicle, the relative importance of the molecular-transport effects behind the shock (in the form of the 'shock slip') and the wall-slip effects are studied. In the flow regime where the shock-transition-zone thickness remains small compared to the shock radius of curvature, a quasi-one-dimensional shock structure under the Burnett/thirteen-moment approximation, as well as particulate/collisional models, can be consistently developed. The fully viscous version of the shock-layer model is shown to provide the crucial boundary condition downstream the shock in this case. The gas-kinetic basis of the continuum description for the flow behind the bow shock, and certain features affecting the non-equilibrium flow chemistry, are also discussed. Author

A88-48146 **SOLUTION OF COUPLED HEAT TRANSFER PROBLEMS IN THE CASE OF FLOW PAST THERMALLY THIN BODIES USING THE DIFFERENCE FACTORIZATION METHOD [RESHENIE SOPRIAZHENNYKH ZADACH TEPLOOBMENA PRI OBTEKANII TERMICHESKI TONKIKH TEL METODOM PRAGONKI]**

A. I. MAZUR, I. I. ZAKHAROV, and I. G. DAVYDENKO (AN USSR, Institut Tekhnicheskoi Teplofiziki, Kiev, Ukrainian SSR) Promyshlennaia Teplotekhnika (ISSN 0204-3602), vol. 10, no. 3, 1988, p. 51-58. In Russian. refs

An analysis is made of experimental data on local and mean heat transfer in an impinging single circular jet issuing from a cylindrical opening of varying relative length. The relationship between the aerodynamic characteristics and heat transfer is established by means of functions of the normalized distance to the obstacle surface. It is shown that, as the relative length of the opening is reduced, the intensity of heat transfer in the region of accelerated flow on the obstacle increases. The advantages of a thin wall, however, become insignificant with an increase in the averaging surface radius and in the distance to the nozzle opening. Empirical expressions are presented for calculating heat transfer at the critical point. V.L.

A STREAMWISE VORTEX EMBEDDED IN A PLANE MIXING LAYER

JAMES H. BELL and RABINDRA D. MEHTA (Stanford University, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 193-200. refs (Contract NCC2-294) (AIAA PAPER 88-3606)

Experimental results are presented on the interaction of a single streamwise vortex with a plane turbulent mixing layer. In the present setup, the vortex is generated by a half-delta wing mounted in the settling chamber of a blower-driven wind tunnel. Initially, the vortex is shown to ride just below the mixing layer, locally distorting the mean velocity and turbulence Reynolds stress distributions in the lower part of the mixing layer. Once the vortex becomes embedded within the mixing layer, the distortions are found to spread through the whole width of the layer, and the induced extra strain rates in the mixing layer result in the generation of additional, relatively large, Reynolds normal and shear stresses, mainly in the regions above the vortex. R.R.

TVD SOLUTION OF THE INCOMPRESSIBLE NAVIER-STOKES EQUATIONS WITH AN IMPLICIT MULTIGRID SCHEME

JOSEPH J. GORSKI (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 394-401. refs

(Contract N00024-86-WR-10432)

(AIAA PAPER 88-3699)

The Navier-Stokes equations for steady incompressible flows, in primitive variable form, have been solved using the pseudo-compressibility concept. The present paper deals with applying a third order accurate upwind differenced Total Variational Diminishing (TVD) scheme to the convection terms coupled with standard central differences for the viscous diffusion terms. The equations are solved using approximate factorization with an implicit multigrid method for convergence acceleration. This method of solving the Navier-Stokes equations has been implemented in the David Taylor Navier-Stokes (DTNS) series of multiple block computer codes which are demonstrated here. Solutions are provided for laminar and turbulent flows along with convergence histories. These results demonstrate that the use of the multigrid scheme can increase convergence rates dramatically. In addition, it is shown that splitting geometries into multiple blocks does not slow down the convergence significantly. Author

APPLICATION OF SPARSE MATRIX SOLVERS AND NEWTON'S METHOD TO FLUID FLOW PROBLEMS

E. E. BENDER and P. K. KHOSLA (Cincinnati, University, OH) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 402-408. refs

(Contract F49620-85-C-0027)

(AIAA PAPER 88-3700)

The use of direct solvers with Newton's method is investigated for the solution of inviscid compressible and viscous incompressible flows. Two modifications of Newton's method are presented that reduce the method's sensitivity to the selection of an initial guess. These methods are tested on transonic inviscid flows to determine the effects of shocks on this sensitivity. Solutions are presented of the full potential equation at various transonic Mach numbers. High Reynolds number laminar separated flows are investigated using these methods. Newton's method applied to such problems exhibits high sensitivity to the initial guess. A modification of Newton's method based on the minimization of the Euclidean norm of the residual greatly reduces this sensitivity. Author

FLOW VISUALIZATION IN A 90 DEGREE BIFURCATION

EUGENIO S. ROSA and JOSEPH M. PRAHL (Case Western Reserve University, Cleveland, OH) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 687-694. refs
(AIAA PAPER 88-3551)

Flow visualization studies of water flowing in the vicinity of a 90-degree bifurcation are conducted in a plexiglas tube for pipe Reynolds numbers from 700 to 1840 and branch flow to main flow ratios from 0.17 to 0.5, (branch flow velocity to main flow velocity ratios from 6 to 18), values encountered in blood flow in the main arteries. Dye injection and hydrogen bubbles reveal complex secondary flow patterns characterized by a pair of contrarotating vortices extending from the branching outlet downstream in the main flow. Similarities between this internal flow and the external flow in the neighborhood of inlets in a cross wind are discussed. Author

(Contract F33615-84-K-3014; AF-AFOSR-85-0075)
(AIAA PAPER 88-3754)

The results of an experimental investigation of the effects of surface roughness on turbulent pipe flow friction factors are presented and compared with predictions from a previously published discrete element roughness model. Friction factor data were acquired over a pipe Reynolds number range from 10,000 to 600,000 for nine different uniformly rough surfaces. These surfaces covered a range of roughness element sizes, spacings and shapes. Predictions from the discrete element roughness model were in very good agreement with the data. Author

(Contract NAG1-776)
(AIAA PAPER 88-3595)

A finite-volume method for the numerical computation of flows with nonequilibrium thermodynamics and chemistry is presented. A thermodynamic model is described which simplifies the coupling between the chemistry and thermodynamics and also results in the retention of the homogeneity property of the Euler equations (including all the species continuity and vibrational energy conservation equations). Flux-splitting procedures are developed for the fully coupled equations involving fluid dynamics, chemical production and thermodynamic relaxation processes. New forms

of flux-vector split and flux-difference split algorithms are embodied in a fully coupled, implicit, large-block structure, including all the species conservation and energy production equations. Several numerical examples are presented, including high-temperature shock tube and nozzle flows. The methodology is compared to other existing techniques, including spectral and central-differenced procedures, and favorable comparisons are shown regarding accuracy, shock-capturing and convergence rates. A SIMPLIFIED OIL-FILM SKIN-FRICTION METER

P. R. BANDYOPADHYAY and L. M. WEINSTEIN (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1487-1499. refs

(Contract NAS1-18235)

(AIAA PAPER 88-3601)

The oil-film method of skin friction measurement, which does not require calibration, nevertheless entails that interferometric measurements of the oil film be obtained. The oil-film method is presently simplified by eliminating interferometry and its requisite polished surface, by taking direct and dynamic measurements of the oil-film slope with a small position-sensing photodiode. This technique has undergone verification in incompressible turbulent and laminar flows in flat-plate boundary layers and pipe flows; the meter is judged to be inexpensive, simple, and robust. O.C.

THREE-DIMENSIONAL COMPUTATION OF ROTORDYNAMIC FORCE DISTRIBUTIONS IN A LABYRINTH SEAL

D. L. RHODE (Texas A & M University, College Station) and S. J. HENSEL IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1664-1673. USAF-supported research. refs
(AIAA PAPER 88-3691)

A numerical method employing a finite difference approach for calculating the rotordynamic force on eccentric, whirling, labyrinth seals has been developed. The SIMPLER algorithm along with QUICK differencing is used to calculate the flowfield within a seal. A modified bipolar coordinate system accurately describes the geometry of an eccentric seal. The high Reynolds number k-epsilon turbulence model is utilized, which can handle subsonic compressible or incompressible flows. A three-percent eccentric single labyrinth cavity rotating at 5000 cpm was investigated with

three different inlet swirl conditions, each with and without a whirl orbit frequency of 2500 cpm. The fluid was air with an inlet axial velocity near Mach 0.2. Detailed force, pressure and shear stress distributions within the cavity are presented. The results indicate that the pressure component accounts for 99 percent of the rotordynamic force. Whirl seems to have little effect on the force, and the downstream tooth of the cavity makes a very significant contribution to this quantity. Author

Research supported by Iowa State University of Science and Technology. refs (Contract NSF ENG-78-12901; NSF MEA-82-11713) (AIAA PAPER 88-3725)

This paper is one in a series reporting on jets discharging to cross-flowing water streams. The experiments were carried out in the 0.61 m x 1.067 m semiclosed circuit water channel at Iowa State University. Hot water was injected vertically upward from a circular pipe located near the channel bottom to simulate the turbulent heated jet. Contours of mean and RMS temperatures both across and along the jet are reported up to lateral and downstream distances of 1.15 and 37 jet diameters, respectively, and for velocity ratios of 1, 2, 4, and 7. The contours were used to explain the complex interaction mechanism between the free stream and the jet in both the jet and wake regions. Author

A88-48987#**UNSTEADY STAGNATION-POINT HEAT TRANSFER DUE TO THE MOTION OF FREESTREAM VORTICES**

E. A. BOGUCZ, E. A. DIRIK, and F. A. LYMAN (Syracuse University, NY) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1893-1900. refs (AIAA PAPER 88-3771)

The effects of freestream vortices on the flow and heat transfer in a stagnation-point boundary layer are considered for the case of a circular cylinder exposed to an approaching pair of counter-rotating line vortices imbedded in an otherwise uniform crossflow. Series expansions are used to formulate a description of the unsteady hydrodynamic and thermal boundary layers in the neighborhood of the stagnation point, and the resulting governing equations are solved numerically for several vortex flow situations. Perturbations in stagnation-point heat transfer of + or - 40 percent are found to be induced by vortex pairs that have strength and separation distance suggested by recent measurements and experiments. In addition, reversed flow in the boundary layer at the stagnation point is found to be produced in cases of practical interest. The results indicate that the effects of freestream vortices may be significant in situations of current engineering interest, such as the interaction of unsteady wakes of turbomachinery blades with downstream surfaces. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 2116-2123. refs (Contract N60921-85-C-0132; DASG60-85-C-0006) (AIAA PAPER 88-3824)

A correlation parameter for film-cooling efficiency has been

developed that removes the low-energy outer-flow restriction on which earlier parameters were based. The parameter is shown to collapse a large body of film-cooling efficiency data over a broad range of coolant-injectant and external-flow conditions embodying all speed ranges. The validity and accuracy of the parameter is independently validated using state-of-the-art CFD techniques. The correlation is extremely useful for the design of film-cooling systems, and should be applicable to a broad range of film-cooling applications. Computational algorithms for calculating film-cooling flow-field-induced boresight error and image-blur aero-optical effects are presented. These algorithms should be extremely useful for the prediction of flow-field effects on optical sensor performance. C.D.

A88-49004#**AN EFFICIENT PATCHED GRID NAVIER-STOKES SOLUTION PROCEDURE FOR MULTIPLE BODIES**

Y. T. CHAN and B. C. WEINBERG (Scientific Research Associates, Inc., Glastonbury, CT) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 2185-2192. refs (Contract DAAL03-87-C-0010) (AIAA PAPER 88-3559)

A novel and efficient procedure is described for solving the time-dependent, multidimensional Navier-Stokes equations concerning multiple body configurations. In contrast to existing patched grid approaches, the present method calculates the entire flow field over both grids simultaneously, without iteration. This procedure could lead to a substantial savings in computer run time, and improved convergence rates could be obtained for steady state problems. A turbomachinery problem involving the flow field in a rotor stator stage is investigated with the procedure. A steady state flow field about a cascade of displaced tandem Joukowski airfoils is considered. The accuracy and CPU time used are compared with the results of a calculation using a continuous deformed grid algorithm and a patched grid with iteration. C.D.

FINITE ELEMENT ANALYSIS OF INCOMPRESSIBLE VISCOUS FLOW AROUND MULTI-ELEMENT AEROFOILS
 MASASHI SHIGEMI *In its* Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 29-35 Nov. 1987
 In JAPANESE; ENGLISH summary
 Avail: NTIS HC A12/MF A01

The Navier-Stokes equation was solved by the finite element method to simulate the laminar flow around airfoils. The concept of the penalty function method was introduced in the finite element method to simplify the implication of the incompressibility constraint. The streamline upwind/Petrov-Galerkin (SU/PG) method was also incorporated to avoid the numerical oscillation in the velocity field, which is known to appear when a simple finite element formulation is applied to flow problems in high Reynolds number region. Three examples were chosen to test the usability of the formulation developed. These are a flow around a symmetric airfoil with zero angle of attack, a flow around an airfoil which is known to show the laminar leading edge separation when the Reynolds number is fairly low, and a flow around an airfoil with flap. All flows obtained showed separation. The separated region of all examples experienced unsteady periodic shedding of vortices except the one on the symmetric airfoil with low Reynolds number, therefore the time marching follows of phenomena became necessary. The theta-method was used to integrate equations with respect to time, with theta between 0.5 and 0.55. The calculated result shows reasonably good agreement with the measured result which accompanies the laminar separation. Even if the airfoil is multi-elemented, there are no particular difficulties in application of this formulation in comparison with the case when the airfoil is single-elemented. Author

THE ROLE OF COMPUTATIONAL FLUID DYNAMICS IN AERONAUTICAL ENGINEERING (5). IMPROVEMENTS AND APPLICATIONS OF IMPLICIT TVD FINITE VOLUME CODE

EIJI SHIMA, KENJI YOSHIDA, and KANICHI AMANO (Japan Aircraft Development Corp., Tokyo.) *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 169-175 Nov. 1987 In JAPANESE; ENGLISH summary
 Avail: NTIS HC A12/MF A01

An automatic grid generator for multiple element airfoils was developed and the existing implicit Total Variation Diminishing (TVD) finite volume code was improved in both accuracy and efficiency, in order to make the Navier-Stokes solver a practical design tool for high lift devices. Utilizing these codes, Navier-Stokes analysis of the single slotted flap was carried out. The automatic grid generator utilizes the elliptic equation solver using the finite difference method combined with the panel method. The flow field is divided into subregions by the dividing stream lines which are calculated by the panel method and the computational grid in each subregion is generated by solving the elliptic equations (Thompson's method). Since the panel method can solve the potential flow around any number of arbitrary shaped bodies, this grid generator can generate a H-type computational grid around such bodies automatically. To obtain a high accuracy on a rapidly stretching grid, the flow solver uses the TVD formulation containing an explicit treatment of nonuniform grid spacing. Converging rate and numerical stability of the flow solver is augmented by the relaxation approach using Symmetric Point Gauss Seidel method in matrix inversion process which is necessary for an implicit scheme. ON THE STATIONARY SOLUTIONS OF THREE-DIMENSIONAL EULER EQUATIONS BY THE TVD DIFFERENCE SCHEMES

YOKO TAKAKURA, TOMIKO ISHIGURO, and SATORU OGAWA (National Aerospace Lab., Tokyo, Japan) *In* National Aerospace Lab., Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics p 211-216 Nov. 1987 In JAPANESE; ENGLISH summary
 Avail: NTIS HC A12/MF A01

Numerical estimations are performed for the improved TVD schemes (Harten-Yee and Chakravarthy-Osher numerical fluxes) and also for the classical schemes with artificial dissipation models (Beam-Warming and Obayashi numerical fluxes) through a series of numerical experiments for three-dimensional inviscid flows around the ONERA M6 wing. Numerical experiments indicate that the two TVD numerical fluxes are excellent in the points that they capture shock waves without numerical oscillations and rapid expansions sharply and that they have the robustness and the self-adjusting mechanisms regarding the numerical viscosity. On the other hand the Obayashi numerical flux is not capable of capturing the rapid expansions sharply like the Beam-Warming numerical index, although the former captures the shock waves without numerical oscillations. WORLD-WIDE AERONAUTICAL SATELLITE COMMUNICATIONS

PETER WOOD and KEITH SMITH *In* Jet Propulsion Lab., Proceedings of the Mobile Satellite Conference p 57-62 May 1988
 Avail: NTIS HC A23/MF A01 CSCL 17B

INMARSAT decided to expand the spectrum covered by its new generation of satellites, INMARSAT-2, to include 1 MHz (subsequently increased to 3 MHz) of the spectrum designed for aeronautical use. It began a design study that led to the specifications for the system that is now being implemented. Subsequently, INMARSAT awarded contracts for the design of avionics and high gain antennas to a number of manufacturers, while several of the signatories that provide ground equipment for communicating with the INMARSAT satellites are modifying their earth stations to work with the avionic equipment. As a result of

these activities, a world-wide aeronautical satellite system supporting both voice and data will become operational in 1989.

Avail: NTIS HC A23/MF A01 CSCL 17B

The Mobile Satellite Experiment (MSAT-X) phased array antenna is being modified to meet future requirements. The proposed system consists of two high gain antennas mounted on each side of a fuselage, and a low gain antenna mounted on top of the fuselage. Each antenna is an electronically steered phased array based on the design of the MSAT-X antenna. A beamforming network is connected to the array elements via coaxial cables. It is essential that the proposed antenna system be able to provide an adequate communication link over the required space coverage, which is 360 degrees in azimuth and from 20 degrees below the horizon to the zenith in elevation. Alternative design concepts are suggested. Both open loop and closed loop backup capabilities are discussed. Typical antenna performance data are also included.

DEVELOPMENT OF AN 8000 BPS VOICE CODEC FOR AVSAT
 JOSEPH F. CLARK *In Jet Propulsion Lab., Proceedings of the Mobile Satellite Conference p 521-526 May 1988*

Avail: NTIS HC A23/MF A01 CSCL 17B

Air-mobile speech communication applications share robustness and noise immunity requirements with other mobile applications. The quality requirements are stringent, especially in the cockpit where air safety is involved. Based on these considerations, a

decision was made to test an intermediate data rate such as 8.0 and 9.6 kb/s as proven technologies. A number of vocoders and codec technologies were investigated at rates ranging from 2.4 kb/s up to and including 9.6 kb/s. The proven vocoders operating at 2.4 and 4.8 kb/s lacked the noise immunity or the robustness to operate reliably in a cabin noise environment. One very attractive alternative approach was Spectrally Encoded Residual Excited LPC (SE-RELP) which is used in a multi-rate voice processor (MRP) developed at the Naval Research Lab (NRL). The MRP uses SE-RELP at rates of 9.6 and 16 kb/s. The 9.6 kb/s rate can be lowered to 8.0 kb/s without loss of information by modifying the frame. An 8.0 kb/s vocoder was developed using SE-RELP as a demonstrator and testbed. This demonstrator is implemented in real time using two Compaq 2 portable computers, each equipped with an ARIEL DSP016 Data Acquisition Processor.

(NASA-TM-100587; NAS 1.15:100587) Avail: NTIS HC A03/MF A01 CSCL 20E

A galvanometer mirror-based laser light sheet system has been developed for use in the Basic Aerodynamics Research Tunnel at NASA Langley. This system generates and positions single or multiple light sheets over aeronautical research models being tested in the low speed tunnel. This report describes a twin mirrored galvanometer laser light sheet generator and shows typical light sheet arrangements in use. With this system, illumination of smoke entrained in the flow over a delta wing model reveals the vortical flow produced by the separation of the flow at the leading edge of the model. The light sheet system has proven to be very adaptable and easy to use in sizing and positioning light sheets in wind tunnel applications.

The rule-based Computer-Aided Markov Evaluator (CAME) program was expanded in its ability to incorporate the effect of fault-handling processes into the construction of a reliability model.

12 ENGINEERING

The fault-handling processes are modeled as semi-Markov events and CAME constructs and appropriate semi-Markov model. To solve the model, the program outputs it in a form which can be directly solved with the Semi-Markov Unreliability Range Evaluator (SURE) program. As a means of evaluating the alterations made to the CAME program, the program is used to model the reliability of portions of the Integrated Airframe/Propulsion Control System Architecture (IAPSA 2) reference configuration. The reliability predictions are compared with a previous analysis. The results bear out the feasibility of utilizing CAME to generate appropriate semi-Markov models to model fault-handling processes. PREDICTION OF FATIGUE LIFE OF NOTCHED SPECIMENS UNDER AIRCRAFT LOADING AND IMPORTANCE OF THE RELATIVE METHOD IN THE CASE OF LOCAL STRAIN APPROACH, PART 2

A. BUCH and A. BERKOVITS May 1987 42 p Sponsored in part by the SENIEL OSTROV research fund and the TECHNION VPR fund

(TAE-595-PT-2) Avail: NTIS HC A03/MF A01

The aim of the research was to compare life predictions obtained from block-by-block counting using a versatile computer program (LSA2) with those obtained in cycle-by-cycle counting from another program. For better understanding of the effect of memory rules on the predictive accuracy, the comparison of the prediction with experiment covered both LSA versions for both corrected and uncorrected cases. The life predictions are dependent on the value of K used in Neuber's relation. Therefore, the calculations were sometimes performed in parallel using both $K=K_{sub T}$ and $K=K_{sub F}$. Results of maneuver loading spectra for both Ti and Al alloy aircraft materials are considered. Prediction of the effect of stress concentration and material variation is verified for LSA predictions. Application of the relative method for fully randomized loading spectra is extended to a variety of steels and $K_{sub T}$ values. J.P.B.

IMPROVED METHOD FOR STRESS AND COMPATIBILITY ANALYSIS OF MULTICOMPONENT ROTATING SYSTEMS

GERALD A. CAREK Jun. 1988 31 p
(NASA-TM-100884; E-4117; NAS 1.15:100884) Avail: NTIS HC A03/MF A01 CSCL 20K

An improved method of analyzing multicomponent rotating assemblies for the determination of operating stresses and component compatibility has been developed. In this method, a single finite element model is developed which contains all of the separate components in the rotating assembly. This is made possible by using gap elements to simulate the contact surfaces between components. The MARC finite element computer program is then used to perform the analysis. This improved method is less time consuming and more reliable than the conventional method of analyzing such systems. Results are presented for two different stress-compatibility analyses of a six-component axial flow compressor rotor. The results for the previously used flexibility analysis method are compared with those for the improved analysis method. The stresses predicted by each method compare quite well with each other. The predictions of the component compatibility, as well as the magnitude of the forces at the contact surfaces, also compare well for these two analysis procedures. It is therefore recommended that the improved analysis method be used to determine the stress-compatibility characteristics of multicomponent rotating systems. Author

PRELIMINARY DESIGN AND ANALYSIS OF PROCEDURES FOR THE NUMERICAL GENERATION OF 3D BLOCK-STRUCTURED GRIDS

J. W. BOERSTOEL 13 Aug. 1986 80 p

(Contract NIVR-311.1-1101/01604N)
(NLR-TR-86102-U; B8803895; ETN-88-92601) Avail: NTIS HC A05/MF A01

Approaches to grid generation are analyzed. A grid-generation procedure for complex aircraft configurations could be based on a combination of three subprocesses: decomposition of the flow domain into 100 hexahedral blocks; trilinear transfinite interpolation to generate initial grid point distributions; and elliptic mesh-size tuning and smoothing. To get insight into this procedure, mathematical models of the subprocesses were worked out. The results of the analysis are technical concepts required or desirable in the grid-generation procedure. The numerical simulation on a shared memory multiprocessor of unsteady separated flows around a body is studied. The two-dimensional equations are solved in stream function and vorticity formulations. The method combines highly accurate finite difference schemes and alternating direction implicit techniques. The algorithm parallelization is based on splitting the computational domain into subdomains. The performances of the parallel code are presented. The results of the simulation of a pulse-started NACA 0012 airfoil for different angles of attack and Reynolds numbers up to 100,000 are presented. ESA

The method is based on assuming linear vortices distributed over the profile divided in N segments. The wake is examined by means of turbulent layers. The profiles studied at variable incidence are described. The results depend on the procedures of wake analysis (layers with interpolation, point turbulence with or without vortex coalescence) and also on parameters such as the time step and the inertial flow around the profile. STUDY ON THE HEAT RESISTING AND COOLING PROPERTY OF THE CERAMICS-METAL HYBRID STATOR VANES

TORU HISAMATSU, TOSHIO ABE, TERUHIDE HAMAMATSU, HIROSHI MIYATA, SHIRO IZIMA, TAKAHASHI, ICHIRO, and RYOICHIRO OSHIMA Jun. 1987 28 p In JAPANESE; ENGLISH summary
(DE88-753117; CRIE-W-86033) Avail: NTIS (US Sales Only) HC A03

20 MW class gas turbine stator blade was designed and test-made. Combustion gas with temperature up to 1,600°C was flown to five wings in a row. Temperature of the metal core reduced its influence as the amount of the cooling air increased; in the case of s/s with maximum allowable temperature of 600°C, required amount of cooling air was found to be roughly 0.5 percent of the total amount of the compressed air (1/10 of the metal, air-cooled blades), which coincided with the results of analysis. Concerning the temperature distribution of the ceramic shell, big difference

was found in the front edge surface (outer and inner); more temperature reduction was found at the rear edge of the blade at the time of shut-down. The results of analysis were the same as that of the heat impact test of the single ceramic body. It is hereafter desirable to consider the generation of the thermal stress and to improve the shell structure. DOE

STRESS CONCENTRATION AROUND CIRCULAR HOLE IN A COMPOSITE MATERIAL SPECIMEN REPRESENTATIVE OF THE X-29A FORWARD-SWEPT WING AIRCRAFT

HSIEN-YANG YEH Aug. 1988 22 p
 (Contract NGT-05020412)
 (NASA-CR-179435; H-1435; NAS 1.26:179435) Avail: NTIS HC A03/MF A01 CSCL 20K

The theory of anisotropic elasticity was used to evaluate the anisotropic stress concentration factors of a composite laminated plate containing a small circular hole. This advanced composite material was used to manufacture the X-29A forward swept wing. Observe that the usual isotropic material stress concentration factor is three. However, for composite material, it was found that the anisotropic stress concentration factor is no longer constant, and that the locations of maximum tangential stress points could shift by changing the fiber orientation with respect to the loading axis. The analysis showed that through the lamination process, the stress concentration factor could be drastically reduced, and therefore the structural performance could be improved. Both the mixture rule approach and the constant strain approach were used to calculate the stress concentration factor. The results predicted by the mixture rule approach were about 20 percent deviate from the experimental data. However, the results predicted by the constant strain approach matched the testing data very well. This showed the importance of the inplane shear effect on the evaluation of stress concentration factor for the X-29A composite plate.

A GENERAL-PURPOSE APPROACH TO COMPUTER-AIDED DYNAMIC ANALYSIS OF A FLEXIBLE HELICOPTER

OM P. AGRAWAL (University of Southern Illinois, Carbondale.)
 Jul. 1988 27 p
 (NASA-TM-101002; A-88183; NAS 1.15:101002) Avail: NTIS HC A03/MF A01 CSCL 20K

A general purpose mathematical formulation is described for dynamic analysis of a helicopter consisting of flexible and/or rigid bodies that undergo large translations and rotations. Rigid body and elastic sets of generalized coordinates are used. The rigid body coordinates define the location and the orientation of a body coordinate frame (global frame) with respect to an inertial frame. The elastic coordinates are introduced using a finite element approach in order to model flexible components. The compatibility conditions between two adjacent elements in a flexible body are imposed using a Boolean matrix, whereas the compatibility conditions between two adjacent bodies are imposed using the Lagrange multiplier approach. Since the form of the constraint equations depends upon the type of kinematic joint and involves only the generalized coordinates of the two participating elements, then a library of constraint elements can be developed to impose the kinematic constraint in an automated fashion. For the body constraints, the Lagrange multipliers yield the reaction forces and torques of the bodies at the joints. The virtual work approach is used to derive the equations of motion, which are a system of differential and algebraic equations that are highly nonlinear. The formulation presented is general and is compared with hard-wired formulations commonly used in helicopter analysis. Author

CHARACTERISTICS OF MICROBURSTS IN THE CONTINENTAL UNITED STATES

MARILYN M. WOLFSON (MIT, Lexington, MA) *The Lincoln Laboratory Journal* (ISSN 0896-4130), vol. 1, Spring 1988, p. 49-74. FAA-sponsored research. refs

A number of meteorologically distinct phenomena generating strong surface outflows have come to be considered 'microbursts'; an effort is presently made to categorize these phenomena according to their meteorological basis and actual aviation-hazard potential, in order to compile a coherent body of knowledge on which automated algorithms for microburst detection and prediction can be based. Microburst-producing air mass storms pose the greatest hazard to aviation due to their relatively high frequency, rapid development, strong small-scale outflows, and lack of translational motion. Yet, storms that are indistinguishable from these both visually and on conventional aircraft radar are successfully traversed by aircraft on a regular basis. O.C.

GEOGRAPHICAL INFORMATION FOR DESIGN PURPOSES

T. D. DEWITTE 11 Feb. 1987 28 p IN DUTCH; ENGLISH summary
 (NLR-MP-87014-U; B8803802; ETN-88-92608) Avail: NTIS HC A03/MF A01

The preparation and use of geographical information for design purposes are reviewed. Digital geographical information distinguishes structured and unstructured information. Structured information concerns numerically ordered features. Unstructured information concerns images of areas recorded by scanning maps. This led to a geographic information base, applied to a route-planning system for aircraft. Requirements with respect to information availability, up-to-dateness, accessibility are severe, so it is necessary to provide the system with dedicated application data bases. Two steps in designing a geographical information system are distinguished: a subsystem for the preparation of the application data bases, and a subsystem for the use of the geographical data. This system uses structured (e.g., terrain elevation) and unstructured geographical information (digital map images). Digital maps can also be composed from structured information using the specific geographical features. ESA

AIR BREATHING PROPULSION EDUCATION SOFTWARE FOR PCS

JACK D. MATTINGLY (USAF, Aero Propulsion Laboratory and Institute of Technology, Wright-Patterson AFB, OH) AIAA, ASME, SAE, and ASEE, Joint Propulsion Conference, 24th, Boston, MA, July 11-13, 1988. 11 p. (AIAA PAPER 88-2977)

User friendly, air breathing propulsion software has been developed for use in both undergraduate and graduate courses at the Air Force Academy and Air Force Institute of Technology, respectively. Specific software has been developed for use on personal computers (PCs) to facilitate learning air breathing propulsion. To date, programs have been written for compressible flow functions, normal and oblique shock functions, engine on-design (design point) analysis, engine off-design analysis, aircraft system constraint analysis, aircraft system mission analysis, conceptual fan and compressor design, and conceptual turbine design. For ease of portability to many computers, most programs are written in FORTRAN 77. The basic operation of the programs and examples of their use in air breathing propulsion courses are presented. A SIMULATION STUDY OF A MODEL REFERENCE ADAPTIVE CONTROL LOADING SYSTEM FOR OPERATIONAL FLIGHT TRAINERS

JOHN P. GARNER (Systems Control Technology, Inc., Lexington Park, MD) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 169-176. refs

This paper discusses a simulation study related to the design of an adaptive model reference control (AMRC) system for use in control loading subsystems for aircraft training simulators. The algorithm provides the capability to adapt Kalman filter gains and control system gains in real time to maintain control loader accuracy during motor parameter variations. The concept of AMRC is introduced and the role of control loaders in aircraft simulators is discussed. Results from the simulation study are presented and described. Author

PARALLEL PROCESSING SCHEMES FOR THE BLOCK-STRUCTURED SOLUTION OF TRANSONIC FLOWS

AKIN ECER and JOHN T. SPYROPOULOS (Purdue University, Indianapolis, IN) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 191-195. refs

Parallel processing schemes developed for the block-structured solution of the three-dimensional Navier-Stokes equations are presented. These schemes allow calculation of flow fields over realistic aerodynamic configurations employing the capabilities of current computer systems. Through the introduction of a Clebsch transformation of the velocity field, an equivalent set of the steady Navier-Stokes equations is obtained. The resulting equations are solved by the finite element method employing a block-structured relaxation scheme. The solution domain is subdivided into

subdomains, or blocks, and the equations are solved in an uncoupled form for each block with appropriate Dirichlet and Neumann-type boundary conditions. Parallel processing techniques for implementing the derived block-structured scheme on CRAY XMP, IBM 3090 and INTEL IPSC families of computer systems are discussed. Author

EVENT-DRIVEN VERSUS INTERRUPT-DRIVEN FLIGHT SIMULATION METHODOLOGIES

B. A. SATHRE (Martin Marietta Corp., Orlando, FL) IN: 1987 Annual Summer Computer Simulation Conference, 19th, Montreal, Canada, July 27-30, 1987, Proceedings. San Diego, CA, Society for Computer Simulation, 1987, p. 797-802. refs

The use of event-driven and interrupt-driven scheduling for real-time flight simulation activities is discussed. The first method activates processes triggered by external events such as setting changes as well as internal events such as responses to other processes. In interrupt-driven methodology, the triggering event becomes an internal timer, set to some predetermined frame rate per time unit; it issues an interrupt upon expiration. The simulation of real-time aircraft activities for the purpose of pilot training is used as an example of the combination of event-driven and interrupt-driven processes. K.K.

AN ADAPTIVE REMESHING METHOD FOR FINITE ELEMENT THERMAL ANALYSIS

EARL A. THORNTON and GURURAJA R. VEMAGANTI (Old Dominion University, Norfolk, VA) AIAA, Thermophysics, Plasmadynamics and Lasers Conference, San Antonio, TX, June 27-29, 1988. 16 p. refs (Contract NSG-1321) (AIAA PAPER 88-2662)

A finite element remeshing approach that makes use of quadrilateral and triangular elements is described. The approach uses the solution on a previous mesh to create a new mesh. Meshes are completely unstructured with highly refined elements in regions of steep gradients and larger elements where gradients are smaller. Studies of convergence rates for heat conduction problems with exact solutions show that for problems with highly localized solution variations, the remeshing approach gives smaller solution errors with fewer unknowns than refinement of uniform, structured meshes. ACCURATE MULTIGRID SOLUTION OF THE EULER EQUATIONS ON UNSTRUCTURED AND ADAPTIVE MESHES

DIMITRI J. MAVRIPLIS (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 1. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 419-426. refs (AIAA PAPER 88-3706)

A method for accurately solving inviscid compressible flow in the subcritical and supercritical regimes about complex configurations is presented. The method is based on the use of unstructured triangular meshes in two dimensions, and special emphasis is placed on the accuracy and efficiency of the solutions. High accuracy is achieved by careful scaling of the artificial dissipation terms, and by reformulating the inner and outer boundary conditions for both the convective and dissipative operators. An adaptive grid refinement strategy is presented which enhances the solution accuracy for complex flows. When coupled with an unstructured multigrid algorithm, this method is shown to produce an efficient solver for flows about arbitrary configurations. Author

PERFORMANCE LIMITATIONS IN PARALLEL PROCESSOR SIMULATIONS

E. PEARSE O'GRADY (Arizona State University, Tempe) and CHUNG-HSIEN WANG (Sierra Semiconductor, Inc., San Jose,

CA) Society for Computer Simulation, Transactions (ISSN 0740-6797), vol. 4, Oct. 1987, p. 311-330. refs
(Contract NAG3-113)

A jet-engine model is partitioned and simulated on a parallel processor system consisting of five 8086/8087 floating-point computers. The simulation uses Heun's integration method. A near-optimal parallel simulation (in the sense of minimum execution time) achieves speedup of only 2.13 and efficiency of 42.6 percent, in effect wasting 57.4 percent of the available processing power. A detailed analysis identifies and graphically demonstrates why the system fails to achieve ideal performance (viz., speedup of 5 and efficiency of 100 percent). Inherent characteristics of the problem equations and solution algorithm account for the loss of nearly half of the available processing power. Overheads associated with interprocessor communication and processor synchronization account for only a small fraction of the lost processing power. The effects of these and other factors which limit parallel processor performance are illustrated through real-time timing-analyzer tracers describing the run/idle status of the parallel processors during the simulation. THE CONSTRUCTION OF COMPOSITE GRIDS FOR GENERAL THREE-DIMENSIONAL REGIONS Ph.D. Thesis

YEON SEOK CHAE 1987 258 p

Avail: Univ. Microfilms Order No. DA8728921

The construction of a two dimensional, two block and four block system for a coastal grid; a three dimensional single block system for a wing-body configuration, a three dimensional 37-block and 13-block system for a wing-body-pylon-store configuration are discussed. Eglin's EAGLE code, which has a surface and grid generation systems for general, three dimensional, composite or multiblock grids based on algebraic and elliptic grid generation techniques, is used for this research. Introduced are several symbolic surface and grid generation runstreams for single block wing-body configurations and, 37-block and 13-block wing-body-pylon-store configurations. These runstreams can be used for other types of wing-body-pylon-store configurations. The detailed construction and the editing procedure of each surface and grid generation runstream are also discussed. The purpose of this research included the generation of various grids without obtaining solutions with a flow solver. Dissert. Abstr.

R. K. AMIET Journal of Fluid Mechanics (ISSN 0022-1120), vol. 192, July 1988, p. 535-560. refs

Linear acoustic theory is used to determine the thickness noise produced by a supersonic propeller with sharp leading and trailing edges. The method reveals details of the calculated waveform. Abrupt changes of slope in the pressure-time waveform which are produced by singular points entering or leaving the tip blade are pointed out. It is found that the behavior of the pressure-time waveform is closely related to changes in the retarded rotor shape. The results indicate that logarithmic singularities in the waveform are produced by regions on the blade edges that move towards the observer at sonic speed, with the edge normal to the line joining the source point and the observer. AERODYNAMIC INTERACTION TONES OF A MODEL COUNTER-ROTATING PROPELLER

R. T. NAGEL and H. V. L. PATRICK (North Carolina State University, Raleigh) (ICAS, Conference, 15th, London, England, Sept. 7-12, 1986) AIAA Journal (ISSN 0001-1452), vol. 26, April 1988, p. 498-500.

A coherence analysis of the interaction between the radiated sound of contrarotating propellers and the fluctuating components of velocity between the rotors can be used to identify the existence of noise-flow relationships. The association of flow components with interaction noise can be identified through coherence peaks that are associated with the sums and differences of the blade-passing frequencies. The magnitude of the tones in the sound or flow velocity spectra were not significant in the establishment of coherence. O.C.

EXTENSION OF KIRCHHOFF'S FORMULA TO RADIATION FROM MOVING SURFACES

F. FARASSAT (NASA, Langley Research Center, Hampton, VA) and M. K. MYERS (George Washington University, Hampton, VA) Journal of Sound and Vibration (ISSN 0022-460X), vol. 123, June 22, 1988, p. 451-460. Previously announced in STAR as N87-24160. refs
(Contract NCC1-14)

Kirchhoff's formula for radiation from a closed surface has been used recently for prediction of the noise of high speed rotors and propellers. Because the closed surface on which the boundary data are prescribed in these cases is in motion, an extension of Kirchhoff's formula to this condition is required. In this paper such a formula, obtained originally by Morgans for the interior problem, is derived for regions exterior to surfaces moving at speeds below the wave propagation speed by making use of some results of generalized function theory. It is shown that the usual Kirchhoff formula is a special case of the main result of the paper. The general result applies to a deformable surface. However, the special form it assumes for a rigid surface in motion is also noted. In addition, Morgans' result is further extended by showing that edge line integrals appear in the formula when applied to a surface that is piecewise smooth. Some possible areas of application of the formula to problems of current interest in aeroacoustics are discussed. Author

THICKNESS NOISE OF A PROPELLER AND ITS RELATION TO BLADE SWEEP

symmetric structure and spreading rate similar to subsonic conditions. For an exit velocity equivalent to M greater than 1.2 the jet switched mode to helical structure, resulting in a substantial increase in the spreading rate. A transitional region was determined for M between 1.12 and 1.18 in which the jet switched modes intermittently from axisymmetric to helical. For Mach numbers higher than 1.6, another structure change was observed, related to the emergence of a normal shock in the first shock cell. The structural changes affected the near-field pressure fluctuations of the jet. The jet with the helical structure had a strong sound emission component in the upstream direction which could be related to the higher spreading rate of the jet. Author

THE ROLE OF UNSTEADY AERODYNAMICS IN AEROACOUSTICS

S. PAUL PAO (NASA, Langley Research Center, Hampton, VA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1188-1195. refs (AIAA PAPER 88-3711)

The role of acoustics and unsteady aerodynamics research in understanding the fundamental physics of time-dependent fluid phenomena is reviewed. The key issues are illustrated by considering the sound radiation of turbulent jets and the aeroacoustics of rotating bodies such as helicopter rotors. The importance of computational methods as a link between aerodynamics and acoustics is also discussed. It is noted that where acoustic analogy techniques are sufficiently accurate, unsteady aerodynamics can be used for acoustic prediction. In supersonic problems where acoustics and aerodynamics are coupled, an integrated nonlinear analysis can provide an accurate problem solution. R.R.

THE EFFECT OF FORWARD SKEWED ROTOR BLADES ON AERODYNAMIC AND AEROACOUSTIC PERFORMANCE OF AXIAL-FLOW FAN

JUN WEI (Shanghai Research Institute of General Machinery, People's Republic of China) and FANGYUAN ZHONG (Jiaotong University, Shanghai, People's Republic of China) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1983-1990.

(AIAA PAPER 88-3783)

Based on comparative experiment, this paper deals with using tangentially skewed rotor blades in axial-flow fan. It is seen from the comparison of the overall performance of the fan with skewed bladed rotor and radial bladed rotor that the skewed blades operate more efficiently than the radial blades, especially at low volume flows. Meanwhile, decrease in pressure rise and flow rate of axial-flow fan with skewed rotor blades is found. The rotor-stator interaction noise and broadband noise of axial-flow fan are reduced with skewed rotor blades. Forward skewed blades tend to reduce the accumulation of the blade boundary layer in the tip region resulting from the effect of centrifugal forces. The turning of streamlines from the outer radius region into inner radius region in blade passages due to the radial component of blade forces of skewed blades is the main reason for the decrease in pressure rise and flow rate. TRAILING EDGE FLOWS AND AERODYNAMIC SOUND

JONATHAN GERSHFELD, WILLIAM K. BLAKE, and CHARLES W. KNISELY (David W. Taylor Naval Ship Research and Development Center, Bethesda, MD) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 3. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p.

2133-2140. Navy-supported research. refs (AIAA PAPER 88-3826)

An experimental evaluation of trailing edge noise is given for two dimensional lifting airfoils which have asymmetrically beveled trailing edges. The flows generated by these edges are separated on the low pressure side and attached on the high pressure side. The aeroacoustic dipole strength of the trailing edge noise is quantified by statistical measurements of surface pressures, acoustic field pressures and near-wake velocity profiles. A comparison of the predicted noise using existing analytical models of trailing edge sound is made with actual noise measurements. Measurements of surface pressures and cross spectra between the surface pressures and radiated sound are related to the aeroacoustic spanwise correlation lengths of the sources and to the Green's function of the trailing edge dipoles. RESEARCH INVESTIGATION OF HELICOPTER MAIN ROTOR/TAIL ROTOR INTERACTION NOISE Final Report

J. FITZGERALD and F. KOHLHEPP Washington NASA May 1988 112 p (Contract NAS1-17126) (NASA-CR-4143; NAS 1.26:4143) Avail: NTIS HC A06/MF A01 CSCL 20A

Acoustic measurements were obtained in a Langley 14 x 22 foot Subsonic Wind Tunnel to study the aeroacoustic interaction of 1/5th scale main rotor, tail rotor, and fuselage models. An extensive aeroacoustic data base was acquired for main rotor, tail rotor, fuselage aerodynamic interaction for moderate forward speed flight conditions. The details of the rotor models, experimental design and procedure, aerodynamic and acoustic data acquisition and reduction are presented. The model was initially operated in trim for selected fuselage angle of attack, main rotor tip-path-plane angle, and main rotor thrust combinations. The effects of repositioning the tail rotor in the main rotor wake and the corresponding tail rotor counter torque requirements were determined. Each rotor was subsequently tested in isolation at the thrust and angle of attack combinations for trim. The acoustic data indicated that the noise was primarily dominated by the main rotor, especially for moderate speed main rotor blade-vortex interaction conditions. The tail rotor noise increased when the main rotor was removed indicating that tail rotor inflow was improved with the main rotor present. Author

SIMULATED MEASUREMENT OF POWER FLOW IN STRUCTURES NEAR TO SIMPLE SOURCES AND SIMPLE BOUNDARIES

MICHAEL C. MCGARY Jun. 1988 68 p (NASA-TM-89124; NAS 1.15:89124) Avail: NTIS HC A04/MF A01 CSCL 20A

Advances in electronics technology along with the advent of low cost multichannel Fast Fourier analyzers have made it practical to use higher order central difference formulas to measure power flow in 1- and 2-D structures. The method discussed uses five point differencing for the spatial derivatives in 1-D and a thirteen point difference pattern for the spatial derivatives in 2-D plates and shells. It is assumed that the measuring transducers are accelerometers. An analytical study of the higher order differencing method and the conventional two accelerometer method was performed as a preliminary to the application of these methods to actual aircraft structures. Some classical problems were analyzed in order to simulate and compare the performance of the two

methods under near field measurement conditions. These near field conditions include examples of power flows near simple sources and simple boundaries. The estimates produced by the two methods were compared to the exact solution in each example. Presented are the theory and selected results of the study, which indicate that the bias errors of the two accelerometer method under near field measurement conditions may be much larger than previous studies have suggested. HELICOPTER MAIN-ROTOR NOISE: DETERMINATION OF SOURCE CONTRIBUTIONS USING SCALED MODEL DATA
 THOMAS F. BROOKS, J. RALPH JOLLY, JR. (Planning Research Corp., Hampton, Va.), and MICHAEL A. MARCOLINI Aug. 1988 66 p
 (NASA-TP-2825; L-16399; NAS 1.60:2825) Avail: NTIS HC A04/MF A01 CSCL 20A

Acoustic data from a test of a 40 percent model MBB BO-105 helicopter main rotor are scaled to equivalent full-scale flyover cases. The test was conducted in the anechoic open test section of the German-Dutch Windtunnel (DNW). The measured data are in the form of acoustic pressure time histories and spectra from two out-of-flow microphones underneath and forward of the model. These are scaled to correspond to measurements made at locations 150 m below the flight path of a full-scale rotor. For the scaled data, a detailed analysis is given for the identification in the data of the noise contributions from different rotor noise sources. Key results include a component breakdown of the noise contributions, in terms of noise criteria calculations of a weighted sound pressure level (dBA) and perceived noise level (PNL), as functions of rotor advance ratio and descent angle. It is shown for the scaled rotor that, during descent, impulsive blade-vortex interaction (BVI) noise is the dominant contributor to the noise. In level flight and mild climb, broadband blade-turbulent wake interaction (BWI) noise is dominant due to the absence of BVI activity. At high climb angles, BWI is reduced and self-noise from blade boundary-layer turbulence becomes the most prominent. Author

Model problem development and analysis continues with the Alternate Resonance Tuning (ART) concept. The various topics described are presently at different stages of completion: investigation of the effectiveness of the ART concept under an external propagating pressure field associated with propeller passage by the fuselage; analysis of ART performance with a double panel wall mounted in a flexible frame model; development of a data fitting scheme using a branch analysis with a Newton-Raphson scheme in multiple dimensions to determine values of critical parameters in the actual experimental apparatus; and investigation of the ART effect with real panels as opposed to the spring-mass-damper systems currently used in much of the theory. THE 'FINANCIAL STABILITY' OF AN AIRLINE - QUO VADIS? [DIE 'WIRTSCHAFTLICHE LEISTUNGSFAEHIGKEIT' DES LUFTFAHRTUNTERNEHMENS - QUO VADIS?]

HORST GRAUMANN Zeitschrift fuer Luft- und Weltraumrecht (ISSN 0340-8329), vol. 37, June 1988, p. 129-139. In German. refs

The criteria applied by the FRG transport ministry to evaluate the financial strength and stability of a company applying for the right to provide commercial air services are examined from a legal perspective, responding to criticisms voiced by Zainhofer (1988). The text of the applicable government regulations is examined in detail, and it is argued that the provisions are compatible with recognized legal principles regarding the public safety and similar to regulations governing other means of transportation; the general reasonableness of applying financial criteria is also defended. With regard to the actual enforcement of the regulations, however, a need for greater clarity and definition, perhaps in the form of written guidelines and procedures, is indicated, and it is stressed that economic criteria cannot legally take the place of constant and thorough monitoring of actual flight-safety and aircraft-maintenance performance. JACK NORTHROP AND THE FLYING WING: THE STORY BEHIND THE STEALTH BOMBER

TED COLEMAN (Coleman Engineering Co., Inc., Los Angeles, CA) and ROBERT WENKAM New York, Paragon House, 1988, 304 p. refs

A development history is presented for the aircraft designs of Jack Northrop in the course of a biographical narrative, giving attention to the aerodynamic and structural design influences that led to the 'flying wing' series of experimental, fighter, and long-range bomber configurations. The first of these, built in 1929, retained a conventional empennage; aircraft beginning with the N-1M of 1939, however, were of true all-wing configuration, and included the XP-56 'Silver Bullet' fighter, XB-35 turboprop-powered intercontinental bomber, YB-49 turbojet-powered intercontinental bomber, and XP-79B 'Flying Ram' interceptor. The contributions of Theodore von Karman to these design efforts are noted. O.C.

A REVISIT TO SUPERSONIC-FLOW THEORY IN THE EARLY FIFTIES

H. K. CHENG (Southern California, University, Los Angeles, CA) IN: AIAA, ASME, SIAM, and APS, National Fluid Dynamics Congress, 1st, Cincinnati, OH, July 25-28, 1988, Technical Papers. Part 2. Washington, DC, American Institute of Aeronautics and Astronautics, 1988, p. 1320-1330. refs
 (AIAA PAPER 88-3799)

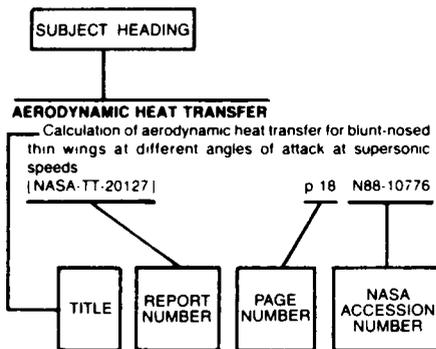

Topics of theoretical studies on supersonic flows at Cornell University in the early fifties are reexamined in three areas: (1) supersonic biplane of finite span, (2) second-order theory of conical

19 GENERAL

flows, and (3) extension of the slender-body/wing theory. These studies, along with related works at Cornell Aeronautical Laboratories, are addressed in the light of subsequent development elsewhere.

Author

Typical Subject Index Listing

The subject heading is a key to the subject content of the document. The title is used to provide a description of the subject matter. When the title is insufficiently descriptive of document content, a title extension is added, separated from the title by three hyphens. The (NASA or AIAA) accession number and the page number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document. Under any one subject heading, the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

- BOUNDARY LAYER CONTROL**
Fundamental experiments on the passive control of the transonic shock/boundary-layer interaction [AAAF PAPER NT-87-17] p 634 A88-46341
Study of the reduction of friction and pressure fluctuations downstream of 'aviation profile'-type manipulators in tandem [AAAF PAPER NT-87-20] p 634 A88-46344

- Drag reduction in two-dimensional flow by vortex emission control using cavities
[AAAF PAPER NT-87-22] p 634 A88-46346
- Controlling the development of boundary layer perturbations through nonuniform surface heating
p 679 A88-48745
- Passive control plate for shock-boundary layer interactions
[AIAA PAPER 88-3537] p 641 A88-48870
- Control of the boundary layer separation about an airfoil by active surface heating
[AIAA PAPER 88-3545] p 642 A88-48878
- Design of low Reynolds number airfoils. II
[AIAA PAPER 88-3764] p 644 A88-48934
- BOUNDARY LAYER FLOW**
- Decay of spanwise wavy inhomogeneities in a three-dimensional turbulent boundary layer over an 'infinite' swept concave wing
p 677 A88-47873
- Flow development on an airfoil with a sharp trailing edge started impulsively from rest
[AIAA PAPER 88-3712] p 644 A88-48920
- Transonic shock/boundary-layer interaction studies - Asymptotic theories, numerical solutions, and the role of turbulence modeling
[AIAA PAPER 88-3800] p 644 A88-48936
- A simplified oil-film skin-friction meter
[AIAA PAPER 88-3601] p 680 A88-48953
- Unsteady stagnation-point heat transfer due to the motion of freestream vortices
[AIAA PAPER 88-3771] p 681 A88-48987
- BOUNDARY LAYER SEPARATION**
- Measurements of turbulent flow behind a wing-body junction
p 635 A88-47467
- Upstream influence and separation scales in fin-induced shock turbulent boundary-layer interaction
p 636 A88-47963
- Passive control plate for shock-boundary layer interactions
[AIAA PAPER 88-3537] p 641 A88-48870
- Control of the boundary layer separation about an airfoil by active surface heating
[AIAA PAPER 88-3545] p 642 A88-48878
- Navier-Stokes solutions of transonic nozzle flow with shock-induced flow separations
[AIAA PAPER 88-3614] p 643 A88-48900
- BOUNDARY LAYER STABILITY**
- Three-dimensional perturbation evolution in a boundary layer with a pressure gradient
p 636 A88-48131
- Controlling the development of boundary layer perturbations through nonuniform surface heating
p 679 A88-48745
- Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing
p 638 A88-48746
- BOUNDARY LAYER TRANSITION**
- On cone frustum pressure gradient effects on transition
p 636 A88-47470
- Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing
p 638 A88-48746
- BOX BEAMS**
- Damage tolerance of a composite multirib wing box
p 657 A88-47213
- BRISTOL-SIDDELEY BS 53 ENGINE**
- From XG15 demonstrator to production Pegasus 11-61 - Improved power plant for AV8B
[AIAA PAPER 88-3185] p 665 A88-48490
- BUBBLES**
- The application of colour helium bubble in the wind tunnel test
p 671 A88-45933
- BUFFERS (CHEMISTRY)**
- Effective use of buffer gas sleeve-type seals in centrifugal compressors
p 677 A88-47566
- BY-PRODUCTS**
- Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products
[OE88-010233] p 674 N88-26492
- C**
- CALIBRATING**
- Calibration of averaging total pressure flight wake rake and natural-laminar-flow airfoil drag certification
[NASA-CR-181630] p 648 N88-25443
- CAMBER**
- Prediction of oscillating thick cambered aerofoil aerodynamics by a locally analytic method
p 636 A88-47771
- CARBOHYDRATE METABOLISM**
- The Daedalus project - Physiological problems and solutions
p 629 A88-46051
- CARBON FIBER REINFORCED PLASTICS**
- Materials trends in military airframes
p 673 A88-46425

CARIBBEAN REGION

- The role of aviation technology in the Caribbean Basin
[NASA-CR-183069] p 630 N88-26289

CASCADE FLOW

- Numerical calculation for the flow field of transonic cascade with inviscid-viscous interaction method
p 630 A88-45937
- Three dimensional finite element analysis for aerodynamic design of fan blades
[AIAA PAPER 88-3641] p 645 A88-48964
- Aerodynamics forces on airfoils at high angles of attack
[AIAA PAPER 88-3696] p 645 A88-48973
- The effect of boundary layer on transonic cascade flow
[AIAA PAPER 88-3782] p 646 A88-48995
- An efficient patched grid Navier-Stokes solution procedure for multiple bodies --- rotor blade configurations
[AIAA PAPER 88-3559] p 681 A88-49004
- Interaction mechanisms between tip leakage flow and the passage vortex in a linear turbine rotor cascade
p 647 A88-49178
- A full quasi-three-dimensional calculation of flow in turbomachines
p 647 A88-49180
- Application of computational fluid dynamics to design of compressor cascade
p 682 N88-25655

CAVITATION FLOW

- Transonic flow modes of an axisymmetric blunt body
[AIAA PAPER 88-3536] p 646 A88-49005

CAVITIES

- Drag reduction in two-dimensional flow by vortex emission control using cavities
[AAAF PAPER NT-87-22] p 634 A88-46346

CENTER OF GRAVITY

- A new method for the estimation of aircraft inertia characteristics
p 661 N88-26530

CENTRIFUGAL COMPRESSORS

- Effective use of buffer gas sleeve-type seals in centrifugal compressors
p 677 A88-47566
- Computation of three dimensional transonic flow in a centrifugal impeller using Euler equations
[AIAA PAPER 88-3731] p 645 A88-48983
- Unsteady flow in a centrifugal compressor with different types of vane diffusers
[ASME PAPER 88-GT-22] p 681 A88-49176

CERAMIC MATRIX COMPOSITES

- Ceramics fire the future
p 674 A88-48455

CERAMICS

- Study on the heat resisting and cooling property of the ceramics-metal hybrid stator vanes
[DE88-753117] p 684 N88-26668

CERTIFICATION

- The certification aspects of microwave landing systems - Airworthiness considerations
p 651 A88-46253
- Calibration of averaging total pressure flight wake rake and natural-laminar-flow airfoil drag certification
[NASA-CR-181630] p 648 N88-25443
- Zero/zero rotorcraft certification issues. Volume 1: Executive summary
[NASA-CR-177483-VOL-1] p 658 N88-25453
- Zero/zero rotorcraft certification issues. Volume 2: Plenary session presentations
[NASA-CR-177483-VOL-2] p 659 N88-25454
- Zero/zero rotorcraft certification issues. Volume 3: Working group results
[NASA-CR-177483-VOL-3] p 659 N88-25455

CH-47 HELICOPTER

- Vibration control at RAF Odiham
p 656 A88-46268

CHANNEL WINGS

- Full 3-D iterative solution of transonic flow for a swept wing test channel
[AIAA PAPER 88-3735] p 646 A88-48986

CHAOS

- Experiments on the forced wake of an airfoil
[AIAA PAPER 88-3840] p 641 A88-48866

CHARACTERIZATION

- A characteristic method for calculating the generalized flat flutter aerodynamic forces
[NASA-TT-20300] p 647 N88-25438

CHASSIS

- A method for determining design contact pressures for moving chassis components on the basis of the specific friction force
p 629 A88-48323

CIRCULAR CYLINDERS

- Analysis of symmetric wake behind a circular cylinder using a direct solution technique and Newton's method
[AIAA PAPER 88-3608] p 645 A88-48942

CIRCULATION CONTROL AIRFOILS

- Control of the boundary layer separation about an airfoil by active surface heating
[AIAA PAPER 88-3545] p 642 A88-48878

CIVIL AVIATION

- Commercial operation of international airlines --- Russian book
p 651 A88-46074

- MLS development and UK requirements --- for ILS-MLS transition planning at British airports
p 653 A88-46252
- MLS: Operational benefits - The FAA viewpoint
p 654 A88-46255

- An international airline's opinion --- on MLS capabilities
p 654 A88-46258

- The UK regional airline view --- on ILS-MLS transition problems
p 654 A88-46259

- Civil operations --- noise reduction in short haul passenger helicopters
p 655 A88-46265

- The 'financial stability' of an airline - Quo vadis?
p 689 A88-46422

- Supersonic propulsion systems and community noise suppression concepts
[AIAA PAPER 88-2986] p 663 A88-46491

- UMMA - Doing it differently --- Un-Manned Micro-Aircraft
p 657 A88-47187

- The challenges and opportunities of supersonic transport propulsion technology
[AIAA PAPER 88-2985] p 665 A88-48032

- Aircraft servicing and maintenance (2nd revised and enlarged edition) --- Russian book
p 629 A88-48704

- Use, nonuse, and abuse of weather radar
p 685 A88-49018

- CLUTTER**
- Simulation of clutter return for an airborne pulse Doppler radar
p 662 A88-46965

CODERS

- Development of an 8000 bps voice codec for AvSat
p 683 N88-25755

CODING

- Performance of the ICAO standard core service modulation and coding techniques
p 683 N88-25723

COHERENT ACOUSTIC RADIATION

- Aerodynamic interaction tones of a model counter-rotating propeller
p 687 A88-47469

COLOR PHOTOGRAPHY

- The application of colour helium bubble in the wind tunnel test
p 671 A88-45933

COMBAT

- A pilot's perspective of the advanced fighter technology integration automated maneuvering attack system
[SAE PAPER 871349] p 662 A88-46053

- High G and high G protection - The operational scenario
p 629 A88-46202

COMBUSTIBLE FLOW

- The development of flux-split algorithms for flows with non-equilibrium thermodynamics and chemical reactions
[AIAA PAPER 88-3595] p 680 A88-48948

COMBUSTION CHAMBERS

- Unique transient combustor test capability
[AIAA PAPER 88-3197] p 664 A88-46498

- Heat transfer in an impinging circular jet with an inhomogeneous initial velocity profile
p 678 A88-48147

- An efficient computational tool for ramjet combustor research
[DE88-010034] p 666 N88-26369

COMBUSTION EFFICIENCY

- Basic research in supersonic combustion
p 674 N88-25623

COMBUSTION PHYSICS

- An engineering model for analysis of scramjet combustor performance with finite rate chemistry
[AIAA PAPER 88-3258] p 664 A88-46501

- Basic research in supersonic combustion
p 674 N88-25623

COMBUSTION STABILITY

- Multi-step dump combustor design to reduce combustion instabilities
[AIAA PAPER 88-2854] p 665 A88-48029

- Basic research in supersonic combustion
p 674 N88-25623

COMMERCIAL AIRCRAFT

- Commercial aircraft structure fatigue - Analysis of expected in-service loading and the prediction of structural component behavior
p 658 A88-48472

COMMUNICATION NETWORKS

- World-wide aeronautical satellite communications
p 682 N88-25688

COMMUNICATION SATELLITES

- MSAT-X phased array antenna adaptations to airborne applications
p 683 N88-25713

- Performance of the ICAO standard core service modulation and coding techniques
p 683 N88-25723

COMPATIBILITY

- Improved method for stress and compatibility analysis of multicomponent rotating systems
[NASA-TM-100884] p 684 N88-25935

COMPOSITE MATERIALS

- Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography
p 676 A88-46826

- Stress concentration around circular hole in a composite material specimen representative of the X-29A forward-swept wing aircraft
[NASA-CR-179435] p 685 N88-26694
- COMPOSITE STRUCTURES**
- Influences of environment and stress history on the composite patch repair of cracked metallic structures p 675 A88-46323
- Damage tolerance of a composite multirib wing box p 657 A88-47213
- The construction of composite grids for general three-dimensional regions p 687 N88-26872
- COMPRESSIBILITY EFFECTS**
- The effects of compressibility on dynamic stall
[AIAA PAPER 88-3541] p 642 A88-48874
- COMPRESSIBLE BOUNDARY LAYER**
- The effect of boundary layer on transonic cascade flow
[AIAA PAPER 88-3782] p 646 A88-48995
- COMPRESSIBLE FLOW**
- Application of sparse matrix solvers and Newton's method to fluid flow problems
[AIAA PAPER 88-3700] p 679 A88-48828
- The effects of compressibility on dynamic stall
[AIAA PAPER 88-3541] p 642 A88-48874
- Goertler vortices in supersonic boundary layers
[AIAA PAPER 88-3678] p 644 A88-48912
- Comparison of experimental and numerical results for delta wings with vortex flaps p 646 A88-49012
- COMPRESSION TESTS**
- Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing
[NASA-CR-172519] p 658 N88-25452
- COMPRESSIVE STRENGTH**
- Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing
[NASA-CR-172519] p 658 N88-25452
- COMPRESSOR BLADES**
- Computation and analysis of the shapes of S1 and S2 streamsurfaces in a transonic compressor rotor
[AIAA PAPER 88-3734] p 646 A88-48985
- COMPRESSORS**
- Experimental vibration damping characteristics of the third-stage rotor of a three-stage transonic axial-flow compressor
[AIAA PAPER 88-3229] p 666 A88-48759
- Application of computational fluid dynamics to design of compressor cascade p 682 N88-25655
- Fluid dynamics of high performance turbomachines
[AD-A192073] p 683 N88-25840
- COMPUTATIONAL FLUID DYNAMICS**

- ENVIRONMENT EFFECTS**
Influences of environment and stress history on the composite patch repair of cracked metallic structures p 675 A88-46323
- EQUILIBRIUM FLOW**
Development of calculation methods for inviscid hypersonic flows
[AAAF PAPER NT-87-03] p 633 A88-46327
- EQUIPMENT SPECIFICATIONS**
MLS development and UK requirements --- for ILS-MLS transition planning at British airports p 653 A88-46252
Propulsion control specifications in integrated flight propulsion control systems
[AIAA PAPER 88-3236] p 664 A88-46500
- ERROR ANALYSIS**
Error auditing in air traffic control p 654 A88-46512
- ESTIMATING**
Unsteady heat transfer coefficient estimation for long duration p 675 A88-46181
- EULER EQUATIONS OF MOTION**
Fast Euler solver for transonic airfoils. I - Theory. II - Applications p 635 A88-47455
Comparison of numerical methods for the calculation of supersonic nozzles p 636 A88-48083
Unsteady delta-wing flow computation using an implicit factored Euler scheme
[AIAA PAPER 88-3649] p 639 A88-48809
Accurate multigrad solution of the Euler equations on unstructured and adaptive meshes
[AIAA PAPER 88-3706] p 686 A88-48830
Numerical solutions of the Euler equations for the flow field around counter-rotating propellers p 649 N88-25638
On the stationary solutions of three-dimensional Euler equations by the TVD difference schemes p 682 N88-25660
Improved potential flow computational methods with Euler corrections for airfoil and wing/body design
[AD-A192303] p 650 N88-26334
- EUROPEAN AIRBUS**
Airbus and ATR system architecture and specification p 662 A88-45952
Airbus training facility combines flight simulation with computer-based instruction p 671 A88-46273
Airbus 1987: Success in Europe
[ETN-88-92099] p 660 N88-26364
- EXHAUST FLOW SIMULATION**
CFD analysis of 3-D effects in scramjet exhaust flow fields
[AIAA PAPER 88-3262] p 664 A88-46502
- EXHAUST SYSTEMS**
Performance evaluation of a two dimensional convergent-divergent ejector exhaust system
[AIAA PAPER 88-2999] p 663 A88-46492
- EXPERT SYSTEMS**
Intelligent guidance and control for wind shear encounter
[NASA-CR-183060] p 653 N88-26347
- F**
- F-106 AIRCRAFT**
Aircraft jolts from lightning bolts p 652 A88-48545
Vortical flow analysis for F-106B configuration
[AIAA PAPER 88-3745] p 640 A88-48842
- F-18 AIRCRAFT**
Static test results of an externally mounted thrust vectoring vane concept
[AIAA PAPER 88-3221] p 665 A88-47073
- FAILURE**
Aircraft accident report: Midair collision of SkyWest Airlines Swearingen METRO 2, N163SW, and Mooney M20, N6485U, Kearns, Utah, January 15, 1987
[PB88-910404] p 653 N88-26346
- FAN BLADES**
Three dimensional finite element analysis for aerodynamic design of fan blades
[AIAA PAPER 88-3641] p 645 A88-48964
The effect of forward skewed rotor blades on aerodynamic and aeroacoustic performance of axial-flow fan
[AIAA PAPER 88-3783] p 688 A88-48996
- FAR FIELDS**
First article noise survey of the A/F32T-9 large turbo fan engine enclosed noise suppressor system, far-field noise, Ellsworth AFB, South Dakota
[AD-A191938] p 666 N88-25457
- FATIGUE (MATERIALS)**
Fatigue strength calculation --- Book p 676 A88-46345
- FATIGUE LIFE**
Fatigue strength calculation --- Book p 676 A88-46345
Computerized life and reliability modelling for turboprop transmissions
[AIAA PAPER 88-2979] p 673 A88-48031
Calculation of aircraft fatigue and damage tolerance p 657 A88-48471
Commercial aircraft structure fatigue - Analysis of expected in-service loading and the prediction of structural component behavior p 658 A88-48472
High-temperature dimensioning of turbine disks p 665 A88-48473
Helicopter transmission fatigue life estimation p 658 A88-49021
Prediction of fatigue life of notched specimens under aircraft loading and importance of the relative method in the case of local strain approach, part 2
[TAE-595-PT-2] p 684 N88-25934
Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371
- FATIGUE TESTS**
Testing large aircraft structures --- B-1 stabilizer p 657 A88-47211
- FAULT TOLERANCE**
Software diversity in computerized control systems p 685 A88-45951
Airbus and ATR system architecture and specification p 662 A88-45952
Analytical redundancy using band-limiting filters p 668 A88-47931
Semi-Markov adjunction to the Computer-Aided Markov Evaluator (CAME)
[NASA-CR-181645] p 683 N88-25924
- FEASIBILITY ANALYSIS**
Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products
[DE88-010233] p 674 N88-26492
- FEEDBACK CONTROL**
Synthesis of an adaptive flight controller under unknown deterministic disturbances p 667 A88-46046
Analytical redundancy using band-limiting filters p 668 A88-47931
Analysis of the technique of robust eigenstructure assignment with application to aircraft control p 668 A88-47932
F-14 modeling study
[NASA-CR-4164] p 669 N88-25462
- FIBER OPTICS**
Overview of NASA research in fiber optics for aircraft controls
[NASA-TM-100919] p 666 N88-25458
Fiber optics for advanced aircraft
[NASA-TM-101294] p 630 N88-26328
- FIELD OF VIEW**
Flight simulator: Field of view utilized in performing tactical maneuvers
[AD-A192412] p 672 N88-26379
- FIGHTER AIRCRAFT**
A pilot's perspective of the advanced fighter technology integration automated maneuvering attack system
[SAE PAPER 871349] p 662 A88-46053
Modern combat aircraft design --- Book p 656 A88-46311
Enhanced fighter engine operability using full authority digital electronic control systems
[AIAA PAPER 88-3266] p 664 A88-46504
Sukhoi Flanker p 657 A88-48451
Automated machining of complex parts and tools - A design-driven manufacturing initiative p 679 A88-48452
Supermaneuverability - Fighter technology of the future p 658 A88-49061
- FILM COOLING**
Hypersonic film cooling effectiveness and aero-optical effects
[AIAA PAPER 88-3824] p 681 A88-49001
- FINANCIAL MANAGEMENT**
The 'financial stability' of an airline - Quo vadis? p 689 A88-46422
- FINITE DIFFERENCE THEORY**
The highly accurate convective difference schemes p 675 A88-45929
Numerical study of incompressible viscous flow over an isolated airfoil p 630 A88-45930
Solution of coupled heat transfer problems in the case of flow past thermally thin bodies using the difference factorization method p 678 A88-48146
Three-dimensional computation of rotordynamic force distributions in a labyrinth seal
[AIAA PAPER 88-3691] p 680 A88-48970
- FINITE ELEMENT METHOD**
Calculation of transonic flow about wing-body-fairing by a finite element method p 635 A88-47255
Analytic and analogue techniques for determining potential distributions around angled cracks p 677 A88-47686
An adaptive remeshing method for finite element thermal analysis
[AIAA PAPER 88-2662] p 686 A88-47986
Three dimensional finite element analysis for aerodynamic design of fan blades
[AIAA PAPER 88-3641] p 645 A88-48964
Finite element analysis of incompressible viscous flow around multi-element aerofoils p 682 N88-25634
Improved method for stress and compatibility analysis of multicomponent rotating systems
[NASA-TM-100884] p 684 N88-25935
- FINITE VOLUME METHOD**
Numerical Navier-Stokes solutions of supersonic slot injection problems
[AIAA PAPER 88-3710] p 640 A88-48834
Control of supersonic intersection flowfields through filleting and sweep
[AIAA PAPER 88-3534] p 641 A88-48869
The development of flux-split algorithms for flows with non-equilibrium thermodynamics and chemical reactions
[AIAA PAPER 88-3595] p 680 A88-48948
The role of computational fluid dynamics in aeronautical engineering (5). Improvements and applications of implicit TVD finite volume code p 682 N88-25653
Preliminary design and analysis of procedures for the numerical generation of 3D block-structured grids
[NLR-TR-86102-U] p 684 N88-26628
- FINS**
Upstream influence and separation scales in fin-induced shock turbulent boundary-layer interaction p 636 A88-47963
- FIRE PREVENTION**
Aircraft accident report: Air New Orleans, DBA continental express flight 962 British Aerospace 3101 (Jetstream 31), N331CY, New Orleans International Airport, Kenner, Louisiana, May 26, 1987
[PB88-910408] p 652 N88-25450
- FIRES**
Current fire safety design aspects of commuter aircraft
[DOT/FAA/CT-87/32] p 652 N88-25448
- FLAPS (CONTROL SURFACES)**
The identification of the direct lift control flap system of the research aircraft ATTAS p 661 N88-26527
- FLAT PLATES**
Viscous unsteady gust aerodynamics of a flat plate airfoil
[AIAA PAPER 88-3701] p 639 A88-48829
Spanwise displacement of a line vortex above a wing - A simple calculation scheme p 647 A88-49024
- FLEXIBILITY**
Empty test section streamlining of the transonic self-streamlining wind tunnel fitted with new walls
[NASA-CR-181680] p 648 N88-25442
- FLEXIBLE WINGS**
Prediction of helicopter rotor discrete frequency noise for three scale models p 688 A88-49014

FLIGHT CHARACTERISTICS

The development of a directional gyroscope for remotely piloted vehicles and similar applications

Airbus 1987: Success in Europe [ETN-88-92099] p 660 N88-26364

FLIGHT CONTROL

Large motion robust flight control of aircraft by equivalent nonlinear elimination p 667 A88-46049
 Compact electromechanical actuation for high performance RPV flight control p 667 A88-47191
 Quasi-steady flight to quasi-steady flight transition for abort landing in a windshear - Trajectory optimization and guidance p 669 A88-49198
 Model reduction methods for control design [NASA-CR-179434] p 687 N88-26144
 Control of flight through microburst wind shear using deterministic trajectory optimization p 670 N88-26375
 Computer simulation of a single pilot flying a modern high-performance helicopter [NASA-TM-100182] p 670 N88-26376

FLIGHT HAZARDS

Flight-management strategies for escape from microburst encounters [NASA-TM-4057] p 669 N88-25461

FLIGHT INSTRUMENTS

Airbus and ATR system architecture and specification p 662 A88-45952

FLIGHT MANAGEMENT SYSTEMS

Active control in tomorrow's marketplace p 668 A88-48497
 Development of an airborne facility for advanced avionics research [NLR-MP-87012-U] p 663 N88-26368

FLIGHT PATHS

Gamma guidance schemes for flight in a windshear p 667 A88-46707
 Manufacturing aspects of some critical high precision mechanical components of inertial devices p 677 A88-47042
 Geographical information for design purposes [NLR-MP-87014-U] p 685 N88-26719

FLIGHT RECORDERS

Simulation data validation system developed p 671 A88-46272

FLIGHT SAFETY

Fallible humans and vulnerable systems - Lessons learned from aviation p 651 A88-46511
 Aircraft field degradation and electromagnetic compatibility [PB88-183975] p 663 N88-25456
 Flight-management strategies for escape from microburst encounters [NASA-TM-4057] p 669 N88-25461

FLIGHT SIMULATION

Helicopter flight simulation - A question of fidelity p 671 A88-46271
 Simulation data validation system developed p 671 A88-46272
 The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volumes 1 & 2 p 671 A88-46427
 Future flight simulation - A military view p 671 A88-46429

FAA's Advanced Simulation Plan influence on simulator design and data acquisition p 672 A88-46440
 Event-driven versus interrupt-driven flight simulation methodologies p 686 A88-46979
 F-14 modeling study [NASA-CR-4164] p 669 N88-25462
 On the dynamic behavior of balloon during its launch; application of panel method and extension to unsteady problem [ISAS-RN-622] p 650 N88-26330
 A high fidelity real-time simulation of a small turboshaft engine [NASA-TM-100991] p 670 N88-26378

FLIGHT SIMULATORS

Helicopter flight simulation - A question of fidelity p 671 A88-46271
 Acceptance procedures to improve the handling fidelity of military flight simulators p 672 A88-46438
 Impact of electrical flight control systems on A320 flight simulator data acquisition p 656 A88-46439
 FAA's Advanced Simulation Plan influence on simulator design and data acquisition p 672 A88-46440
 The integration of airplane avionics equipment in flight simulators p 672 A88-46441
 Event-driven versus interrupt-driven flight simulation methodologies p 686 A88-46979
 Integrated aircraft flight test approaches for fault-tolerant avionics systems [AIAA PAPER 88-2170] p 658 A88-48476
 F-14 modeling study [NASA-CR-4164] p 669 N88-25462

Flight simulator: Field of view utilized in performing tactical maneuvers [AD-A192412] p 672 N88-26379

FLIGHT STRESS (BIOLOGY)

High G and high G protection - The operational scenario p 629 A88-46202

FLIGHT TEST INSTRUMENTS

Trajectory measurement of the Fokker 100 aircraft during autoland testing [NLR-MP-86010-U] p 660 N88-26366
 Development of an airborne facility for advanced avionics research [NLR-MP-87012-U] p 663 N88-26368

FLIGHT TESTS

Turbulent drag reduction research at NASA Langley - Progress and plans p 631 A88-46228
 Use of LEBU-devices for drag reduction at flight conditions p 631 A88-46235
 Flight-test of turbulent skin-friction reduction by riblets p 655 A88-46242
 Overview of flight testing of GE aircraft engines' UDF engine --- Un-Ducted Fan [AIAA PAPER 88-3082] p 664 A88-46495
 A simulation study of a model reference adaptive control loading system for operational flight trainers p 686 A88-46957

Stagnation flow field analysis for an aeroassist flight experiment vehicle [AIAA PAPER 88-2613] p 636 A88-47982
 PTA flight test overview --- Propan Test Assessment [AIAA PAPER 88-2803] p 657 A88-48025
 Avanti- Pushing ahead to certification p 657 A88-48458
 Integrated aircraft flight test approaches for fault-tolerant avionics systems [AIAA PAPER 88-2170] p 658 A88-48476

Active control in tomorrow's marketplace p 668 A88-48497

Flight research and testing [NASA-TM-100439] p 659 N88-26361
 Flight test preparation and measuring data validation for parameter identification p 661 N88-26529
 Utilization of identification methods in the time and frequency domain for the determination of the XV-15 (tilt-rotor) dynamics for lateral motion in hover flight p 661 N88-26532
 Application of complementary parameter identification techniques to flight test data of a transport aircraft p 661 N88-26533

FLIGHT TRAINING

Airbus training facility combines flight simulation with computer-based instruction p 671 A88-46273
 Flight simulator: Field of view utilized in performing tactical maneuvers [AD-A192412] p 672 N88-26379

FLIGHT VEHICLES

Methods of analogy in the aerodynamics of flight vehicles --- Russian book p 637 A88-48201
 Flight vehicle system identification: Status and prospects p 660 N88-26520

FLOATING POINT ARITHMETIC

Performance limitations in parallel processor simulations p 686 A88-49101

FLOW CHARACTERISTICS

Structure of a reattaching supersonic shear flow [AIAA PAPER 88-3615] p 643 A88-48901
 Unsteady flow in a centrifugal compressor with different types of vaned diffusers [ASME PAPER 88-GT-22] p 681 A88-49176

FLOW DEFLECTION

Heat transfer in an impinging circular jet with an inhomogeneous initial velocity profile p 678 A88-48147
 Computation of flow around NACA0012 airfoil at high angle of attack p 649 N88-25640

FLOW DISTORTION

Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing p 638 A88-48746

FLOW DISTRIBUTION

Numerical calculation for the flow field of transonic cascade with inviscid-viscous interaction method p 630 A88-45937
 Experimental and numerical investigation of a propeller with three-dimensional inflow p 631 A88-46221
 Flow around and downstream of pointed or blunt yawed cones in a Mach 7 or 5 stream [AAAF PAPER NT-87-10] p 633 A88-46334
 A new robust 3-D transonic wing design program utilizing Dirichlet-type boundary conditions p 635 A88-47258
 Prediction of oscillating thick cambered aerofoil aerodynamics by a locally analytic method p 636 A88-47771
 Stagnation flow field analysis for an aeroassist flight experiment vehicle [AIAA PAPER 88-2613] p 636 A88-47982

A numerical study of the hot gas environment around a STOV/L aircraft in ground proximity [AIAA PAPER 88-2888] p 665 A88-48752
 Control of supersonic intersection flowfields through filleting and sweep [AIAA PAPER 88-3534] p 641 A88-48869
 Mode switching in supersonic circular jets [AIAA PAPER 88-3610] p 687 A88-48896
 Centerline Mach number characteristics of highly heated free jets [AIAA PAPER 88-3612] p 642 A88-48898
 Transonic shock/boundary-layer interaction studies - Asymptotic theories, numerical solutions, and the role of turbulence modeling [AIAA PAPER 88-3800] p 644 A88-48936
 Navier-Stokes analysis of the performance and flow field of single and counter-rotation propellers [AIAA PAPER 88-3638] p 645 A88-48961
 Three-dimensional computation of rotorodynamic force distributions in a labyrinth seal [AIAA PAPER 88-3691] p 680 A88-48970
 Computation and analysis of the shapes of S1 and S2 streamsurfaces in a transonic compressor rotor [AIAA PAPER 88-3734] p 646 A88-48985
 Evaluation of methods for predicting complex aircraft flowfields p 646 A88-49019
 Application of viscous flow computations for the aerodynamic performance of a backswept impeller at various operating conditions [ASME PAPER 88-GT-39] p 647 A88-49177
 Proceedings of the 5th NAL Symposium on Aircraft Computational Aerodynamics [NAL-SP-8] p 681 N88-25630
 Navier-Stokes analysis of transonic transport aircraft empennage p 649 N88-25637

FLOW EQUATIONS

TVD solution of the incompressible Navier-Stokes equations with an implicit multigrid scheme [AIAA PAPER 88-3699] p 679 A88-48827

FLOW GEOMETRY

The interaction between normal shock and turbulent boundary layer in transonic flow over a curved wall p 630 A88-45936
 Flow around and downstream of pointed or blunt yawed cones in a Mach 7 or 5 stream [AAAF PAPER NT-87-10] p 633 A88-46334
 Flow visualization in a 90 degree bifurcation [AIAA PAPER 88-3551] p 680 A88-48862

FLOW MEASUREMENT

Experimental and numerical investigation of a propeller with three-dimensional inflow p 631 A88-46221
 Hot-wire measurements of near wakes behind an oscillating airfoil [AIAA PAPER 88-3715] p 644 A88-48923

FLOW STABILITY

Three-dimensional perturbation evolution in a boundary layer with a pressure gradient p 636 A88-48131
 Instabilities in the wake/mixing-layer region of a splitter plate separating two supersonic streams [AIAA PAPER 88-3677] p 643 A88-48911
 Fluid dynamics of high performance turbomachines [AD-A192073] p 683 N88-25840

FLOW THEORY

Asymptotic theory of separated flows --- Russian book p 675 A88-46060
 Unsteady wing theory - The Karman/Sears legacy [AIAA PAPER 88-3539] p 641 A88-48872
 A revisit to supersonic-flow theory in the early fifties [AIAA PAPER 88-3799] p 689 A88-48935

FLOW VISUALIZATION

The application of colour helium bubble in the wind tunnel test p 671 A88-45933
 A model for calculating the aerodynamic effects of vortex breakdown on slender wings p 635 A88-47256
 Visualizing the connectivity of vortex systems for pitching wings [AIAA PAPER 88-3549] p 679 A88-48860
 Flow visualization in a 90 degree bifurcation [AIAA PAPER 88-3551] p 680 A88-48862
 Experiments on the forced wake of an airfoil [AIAA PAPER 88-3840] p 641 A88-48866
 A study of the encounter between a helical vortex and a circular cylinder [AIAA PAPER 88-3622] p 643 A88-48906
 Characteristics of multiple shock wave/turbulent boundary layer interactions in rectangular ducts [AIAA PAPER 88-3803] p 644 A88-48937
 A twin-mirrored galvanometer laser light sheet generator [NASA-TM-100587] p 683 N88-25901
 The determination of the topological structure of skin friction lines on a rectangular wing-body combination [NASA-CR-4168] p 651 N88-26343

FLUID DYNAMICS

Fluid dynamics of high performance turbomachines [AD-A192073] p 683 N88-25840

FLUID FILMS
A simplified oil-film skin-friction meter
[AIAA PAPER 88-3601] p 680 A88-48953

FLUID-SOLID INTERACTIONS
Power radiated by an infinite plate subject to fluid loading and line drive p 677 A88-47669

FLUTTER
Flutter suppression within reach p 668 A88-48494
Coupling structure and controls design p 668 A88-48496

FLUTTER ANALYSIS
Prediction of oscillating thick cambered aerofoil aerodynamics by a locally analytic method p 636 A88-47771
Flutter prediction involving trailing-edge control surfaces p 669 A88-49009
Flutter modes of high aspect ratio tailless aircraft p 669 A88-49023
A characteristic method for calculating the generalized flat flutter aerodynamic forces
[NASA-TT-20300] p 647 N88-25438
Parametric flutter studies of an arrow-wing configuration: Some early results
[NASA-TM-100608] p 648 N88-25444

FLUX VECTOR SPLITTING
Development of calculation methods for inviscid hypersonic flows
[AAAF PAPER NT-87-03] p 633 A88-46327
The development of flux-split algorithms for flows with non-equilibrium thermodynamics and chemical reactions
[AIAA PAPER 88-3595] p 680 A88-48948

FLY BY WIRE CONTROL
Airbus and ATR system architecture and specification p 662 A88-45952
Impact of electrical flight control systems on A320 flight simulator data acquisition p 656 A88-46439

FREE FLOW
Jet-wake thermal characteristics of heated turbulent jets in cross flow
[AIAA PAPER 88-3725] p 681 A88-48978
Unsteady stagnation-point heat transfer due to the motion of freestream vortices
[AIAA PAPER 88-3771] p 681 A88-48987
Spanwise displacement of a line vortex above a wing - A simple calculation scheme p 647 A88-49024

FREE JETS
Centerline Mach number characteristics of highly heated free jets
[AIAA PAPER 88-3612] p 642 A88-48898

FRICTION DRAG
Study of the reduction of friction and pressure fluctuations downstream of 'aviation profile'-type manipulators in tandem
[AAAF PAPER NT-87-20] p 634 A88-46344

FRICTION FACTOR
A method for determining design contact pressures for moving chassis components on the basis of the specific friction force p 629 A88-48323
Measurement and prediction of rough wall effects on friction factor - Uniform roughness results
[AIAA PAPER 88-3754] p 680 A88-48926

FRICTION MEASUREMENT
A simplified oil-film skin-friction meter
[AIAA PAPER 88-3601] p 680 A88-48953

FRUSTUMS
On cone frustum pressure gradient effects on transition p 636 A88-47470

FUEL INJECTION
Influence of design concept and liquid properties on fuel injector performance p 675 A88-46226
Subsonic and supersonic combustion using nonaxisymmetric injectors
[AIAA PAPER 88-3141] p 673 A88-48040

FUEL SPRAYS
Influence of design concept and liquid properties on fuel injector performance p 675 A88-46226

FUSELAGES
Measurements of turbulent flow behind a wing-body junction p 635 A88-47467
Vibration testing of ACT fuselage p 659 N88-25627
Research investigation of helicopter main rotor/tail rotor interaction noise
[NASA-CR-4143] p 688 N88-26165

G

GALVANOMETERS
A twin-mirrored galvanometer laser light sheet generator
[NASA-TM-100587] p 683 N88-25901

GAS DYNAMICS
Controlling the development of boundary layer perturbations through nonuniform surface heating p 679 A88-48745

GAS FLOW
Introduction to hypersonic aerodynamics - Modeling problems
[AAAF PAPER NT-87-02] p 633 A88-46326
Rarefied gas numerical wind tunnel 3. Universal code for three dimensional bodies p 649 N88-25644

GAS GENERATORS
Subsonic and supersonic combustion using nonaxisymmetric injectors
[AIAA PAPER 88-3141] p 673 A88-48040

GAS GUNS
Test methods in hypersonics
[AAAF PAPER NT-87-09] p 671 A88-46333

GAS INJECTION
Numerical Navier-Stokes solutions of supersonic slot injection problems
[AIAA PAPER 88-3710] p 640 A88-48834

GAS MIXTURES
Antimisting kerosene: Low temperature degradation and blending
[NASA-CR-182725] p 675 N88-26495

GAS TURBINE ENGINES
Unique transient combustor test capability
[AIAA PAPER 88-3197] p 664 A88-46498
Heat transfer in an impinging circular jet with an inhomogeneous initial velocity profile p 678 A88-48147
Equipment for studying the thermal stressed state of rotating gas turbine components p 678 A88-48148
A crystallographic model for nickel base single crystal alloys p 673 A88-48182
Corrosion prevention in gas turbines
[NLR-MP-87029-U] p 667 N88-26373

GAS TURBINES
Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371
Analysis of gas turbine test cell number 1, Lemoore Naval Air Station, California
[AD-A192870] p 673 N88-26380

GASIFICATION
Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products
[DE88-010233] p 674 N88-26492

GENERAL AVIATION AIRCRAFT
Drag reduction for business aircraft
[AAAF PAPER NT-87-23] p 634 A88-46347

GEOGRAPHIC INFORMATION SYSTEMS
Geographical information for design purposes
[NLR-MP-87014-U] p 685 N88-26719

GEOMAGNETISM
The development of a directional gyroscope for remotely piloted vehicles and similar applications p 662 A88-47030

GEOMETRIC ACCURACY
Manufacturing aspects of some critical high precision mechanical components of inertial devices p 677 A88-47042

GIMBALS
The development of a directional gyroscope for remotely piloted vehicles and similar applications p 662 A88-47030
A two degree of freedom gyroscope with frictionless inner and outer gimbal pick-offs p 662 A88-47031

GOERTLER INSTABILITY
Goertler vortices in supersonic boundary layers
[AIAA PAPER 88-3678] p 644 A88-48912

GOVERNMENT/INDUSTRY RELATIONS
The 'financial stability' of an airline - Quo vadis? p 689 A88-46422

GRAVITATIONAL PHYSIOLOGY
High G and high G protection - The operational scenario p 629 A88-46202
Design considerations for the avoidance of G-LOC --- Gravitational stress induced Loss of Consciousness p 655 A88-46212

GRID GENERATION (MATHEMATICS)
Application of multiple grids topology to supersonic internal/external flow interactions
[AIAA PAPER 88-3568] p 638 A88-48794
Accurate multigrad solution of the Euler equations on unstructured and adaptive meshes
[AIAA PAPER 88-3706] p 686 A88-48830
The role of computational fluid dynamics in aeronautical engineering (5). Improvements and applications of implicit TVD finite volume code p 682 N88-25653
Grid generation of a helicopter rotary-wing p 649 N88-25665

GROUND EFFECT (AERODYNAMICS)
Some thoughts on power-augmented-ram wing-in-ground (PAR-WIG) effect vehicle p 675 A88-46048
Slender wing in ground effect p 635 A88-47466
A numerical study of the hot gas environment around a STOVL aircraft in ground proximity
[AIAA PAPER 88-2888] p 665 A88-48752

GROUND EFFECT MACHINES
Some thoughts on power-augmented-ram wing-in-ground (PAR-WIG) effect vehicle p 675 A88-46048

GROUND SUPPORT SYSTEMS
Remotely piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Conference Papers and Supplementary Papers p 656 A88-47183

GUIDE VANES
Static test results of an externally mounted thrust vectoring vane concept
[AIAA PAPER 88-3221] p 665 A88-47073

GUST LOADS
Filling the expertise gap --- aeroservoelasticity, structures, stability and control design of aerospace vehicles p 668 A88-48495
Coupling structure and controls design p 668 A88-48496
Active control in tomorrow's marketplace p 668 A88-48497

GUSTS
Viscous unsteady gust aerodynamics of a flat plate airfoil
[AIAA PAPER 88-3701] p 639 A88-48829

GYROSCOPES
The development of a directional gyroscope for remotely piloted vehicles and similar applications p 662 A88-47030
A two degree of freedom gyroscope with frictionless inner and outer gimbal pick-offs p 662 A88-47031
Oscillogyro design, manufacture and performance p 662 A88-47032
Manufacturing aspects of some critical high precision mechanical components of inertial devices p 677 A88-47042

GYROSCOPIC STABILITY
Dynamics and control of a gyroscopic force measuring system p 677 A88-47043

GYROSTABILIZERS
Beacon navigation p 654 A88-47194

H

HARRIER AIRCRAFT
From XG15 demonstrator to production Pegasus 11-61 - Improved power plant for AV8B
[AIAA PAPER 88-3185] p 665 A88-48490

HEAT MEASUREMENT
Methods for measuring convection flux in the R2 and R3 wind tunnels at Chalais-Meudon - Current implementation and future developments
[AAAF PAPER NT-87-11] p 676 A88-46335

HEAT RESISTANT ALLOYS
Cyclic oxidation of aluminized Ti-14Al-24Nb alloy p 674 A88-49202

HEAT SOURCES
Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography p 676 A88-46826

HEAT TRANSFER
Heat transfer in an impinging circular jet with an inhomogeneous initial velocity profile p 678 A88-48147

HEAT TRANSFER COEFFICIENTS
Unsteady heat transfer coefficient estimation for long duration p 675 A88-46181

HELICOPTER CONTROL
Helicopter vibration and its reduction; Proceedings of the Symposium, London, England, Nov. 16, 1987 p 655 A88-46260
Helicopter vibration - Its origin and methods of control p 655 A88-46261
Helicopter vibration control in the Fleet Air Arm p 656 A88-46266
Frequency domain identification of the dynamics of a scaled remotely-piloted helicopter p 670 N88-26524

HELICOPTER DESIGN
Blade design, higher harmonic pitch and active structural response control for helicopter vibration minimisation p 656 A88-46270
The use of CFD in helicopter aerodynamic design p 656 A88-46324
Titanium alloys in helicopter rotor head designs p 673 A88-46424

HELICOPTER PERFORMANCE
Diagnostics - An efficient methodology for 'rotor track and balance' p 629 A88-46267
Prediction of helicopter rotor discrete frequency noise for three scale models p 688 A88-49014

HELICOPTER PROPELLER DRIVE
Helicopter transmission fatigue life estimation p 658 A88-49021

HELICOPTERS

- Some aspects of automatic speech recognition under helicopter vibration p 654 A88-46263
 Civil operations --- noise reduction in short haul passenger helicopters p 655 A88-46265
 Helicopter flight simulation - A question of fidelity p 671 A88-46271
 Project ROSAR - A high-resolution, all-weather visibility method for helicopters p 654 A88-46521
 Extension of Kirchhoff's formula to radiation from moving surfaces p 687 A88-47670
 Zero/zero rotorcraft certification issues. Volume 1: Executive summary p 658 N88-25453
 [NASA-CR-177483-VOL-1] p 658 N88-25453
 Zero/zero rotorcraft certification issues. Volume 2: Plenary session presentations [NASA-CR-177483-VOL-2] p 659 N88-25454
 Zero/zero rotorcraft certification issues. Volume 3: Working group results [NASA-CR-177483-VOL-3] p 659 N88-25455
 Grid generation of a helicopter rotary-wing p 649 N88-25665
 Aircraft accident report: Joe Foster Excavating, Inc., Bell 206B, N49606, in-flight collision with trees, Alamo, California, August 3, 1986 [PB88-910405] p 653 N88-26345
 Flight Mechanics Panel Symposium on Rotorcraft Design for Operations: Technical evaluation report [AGARD-AR-243] p 659 N88-26362
 Computer simulation of a single pilot flying a modern high-performance helicopter [NASA-TM-100182] p 670 N88-26376
 Computer simulation of multiple pilots flying a modern high performance helicopter [NASA-TM-100183] p 670 N88-26377
 A high fidelity real-time simulation of a small turboshaft engine [NASA-TM-100991] p 670 N88-26378
 A general-purpose approach to computer-aided dynamic analysis of a flexible helicopter [NASA-TM-101002] p 685 N88-26709
- HELIPORTS**
 Four urban heliport case studies [DOT/FAA/PM-87/32] p 672 N88-25463
- HELIUM**
 The application of colour helium bubble in the wind tunnel test p 671 A88-45933
- HEMISPHERE CYLINDER BODIES**
 A study of the encounter between a helical vortex and a circular cylinder [AIAA PAPER 88-3622] p 643 A88-48906
- HIGH SPEED**
 Extension of Kirchhoff's formula to radiation from moving surfaces p 687 A88-47670
- HIGH TEMPERATURE**
 Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products [DE88-010233] p 674 N88-26492
- HIGH TEMPERATURE ENVIRONMENTS**
 Active-control engines p 665 A88-48456
- HIGH TEMPERATURE GASES**
 A numerical study of the hot gas environment around a STOVL aircraft in ground proximity [AIAA PAPER 88-2888] p 665 A88-48752
 Centerline Mach number characteristics of highly heated free jets [AIAA PAPER 88-3612] p 642 A88-48898

- HYPERSONIC WAKES**
 Flow around and downstream of pointed or blunt yawed cones in a Mach 7 or 5 stream [AAAF PAPER NT-87-10] p 633 A88-46334
- HYPERSONICS**
 Introduction to hypersonic aerodynamics - Modeling problems [AAAF PAPER NT-87-02] p 633 A88-46326
 Development of calculation methods for inviscid hypersonic flows [AAAF PAPER NT-87-03] p 633 A88-46327
 Test methods in hypersonics [AAAF PAPER NT-87-09] p 671 A88-46333

IMAGE PROCESSING

- The circulation of an airfoil starting vortex obtained from instantaneous vorticity measurements over an area [AIAA PAPER 88-3620] p 643 A88-48905

IMPACT DAMAGE

- Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography p 676 A88-46826

IMPACT TESTS

- Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing [NASA-CR-172519] p 658 N88-25452

IMPELLERS

- Computation of three dimensional transonic flow in a centrifugal impeller using Euler equations [AIAA PAPER 88-3731] p 645 A88-48983
 Application of viscous flow computations for the aerodynamic performance of a backswept impeller at various operating conditions [ASME PAPER 88-GT-39] p 647 A88-49177

INCOMPRESSIBLE FLOW

- Numerical study of incompressible viscous flow over an isolated airfoil p 630 A88-45930
 Turbulent drag reduction research at NASA Langley - Progress and plans p 631 A88-46228
 The asymmetric pair of vortices adjacent to a spinning cylinder - A small perturbation solution p 635 A88-47263

- TVD solution of the incompressible Navier-Stokes equations with an implicit multigrid scheme [AIAA PAPER 88-3699] p 679 A88-48827
 Application of sparse matrix solvers and Newton's method to fluid flow problems [AIAA PAPER 88-3700] p 679 A88-48828
 Computation of vortical interaction for a sharp-edged double-delta wing p 646 A88-49017
 Finite element analysis of incompressible viscous flow around multi-element aerofoils p 682 N88-25634

INCOMPRESSIBLE FLUIDS

- Asymptotic theory of separated flows --- Russian book p 675 A88-46060

INERTIA

- A new method for the estimation of aircraft inertia characteristics p 661 N88-26530

INERTIAL GUIDANCE

- Manufacturing aspects of some critical high precision mechanical components of inertial devices p 677 A88-47042
 Dynamics and control of a gyroscopic force measuring system p 677 A88-47043

INERTIAL NAVIGATION

- Oscillogro design, manufacture and performance p 662 A88-47032
 A review of the mechanical design and development of a high performance accelerometer p 677 A88-47047

INFRARED RADIATION

- Sukhoi Flanker p 657 A88-48451

INGESTION (ENGINES)

- A numerical study of the hot gas environment around a STOVL aircraft in ground proximity [AIAA PAPER 88-2888] p 665 A88-48752

INLET FLOW

- Modeling the three-dimensional flow through a scramjet inlet with a hybrid PNS/PPNS code [AIAA PAPER 88-2826] p 637 A88-48483

INLET NOZZLES

- Subsonic and supersonic combustion using nonaxisymmetric injectors [AIAA PAPER 88-3141] p 673 A88-48040

INSTRUMENT LANDING SYSTEMS

- MLS development and UK requirements --- for ILS-MLS transition planning at British airports p 653 A88-46252
 The UK regional airline view --- on ILS-MLS transition problems p 654 A88-46259

INTAKE SYSTEMS

- A numerical study of the hot gas environment around a STOVL aircraft in ground proximity [AIAA PAPER 88-2888] p 665 A88-48752

INTERACTIONAL AERODYNAMICS

- Calculation of unsteady wake/rotor interaction p 631 A88-46223
 Fundamental experiments on the passive control of the transonic shock/boundary-layer interaction [AAAF PAPER NT-87-17] p 634 A88-46341
 Interaction between a compliant surface and the viscous sublayer of a turbulent boundary layer p 676 A88-46914
 Aerodynamic interaction tones of a model counter-rotating propeller p 687 A88-47469

- An efficient multi-methods computer code for the prediction of the inviscid and viscous flow over multi-component airfoils
[AIAA PAPER 88-3562] p 638 A88-48788
Application of multiple grids topology to supersonic internal/external flow interactions
[AIAA PAPER 88-3568] p 638 A88-48794
Passive control plate for shock-boundary layer interactions
[AIAA PAPER 88-3537] p 641 A88-48870
A study of the encounter between a helical vortex and a circular cylinder
[AIAA PAPER 88-3622] p 643 A88-48906
The effect of boundary layer on transonic cascade flow
[AIAA PAPER 88-3782] p 646 A88-48995
Interaction mechanisms between tip leakage flow and the passage vortex in a linear turbine rotor cascade
p 647 A88-49178
Research investigation of helicopter main rotor/tail rotor interaction noise
[NASA-CR-4143] p 688 N88-26165
- INTERFACES**
Ludwig Prandtl collected treatises on applied mechanics, hydro- and aerodynamics, part 2, IV interfaces and resistance
[NASA-TT-20315] p 651 N88-26338
- INTERFERENCE**
Wind tunnel wall interference (January 1980 - May 1988): A selected, annotated bibliography
[NASA-TM-4061] p 672 N88-25466
- INTERNATIONAL COOPERATION**
Commercial operation of international airlines --- Russian book
p 651 A88-46074
- INTERPROCESSOR COMMUNICATION**
Performance limitations in parallel processor simulations
p 686 A88-49101
- INVISCID FLOW**
Numerical calculation for the flow field of transonic cascade with inviscid-viscous interaction method
p 630 A88-45937
Development of calculation methods for inviscid hypersonic flows
[AAAF PAPER NT-87-03] p 633 A88-46327
An improved technique for the solution of inviscid transonic 3D flows
p 634 A88-47252
The effect of boundary layer on transonic cascade flow
[AIAA PAPER 88-3782] p 646 A88-48995
Experimental investigation of three-dimensional forced mixer lobe flow fields
[AIAA PAPER 88-3785] p 666 A88-48997
- ITERATIVE SOLUTION**
An explicit iterative method for determining the intensity of a wing vortex sheet
p 637 A88-48302
Full 3-D iterative solution of transonic flow for a swept wing test channel
[AIAA PAPER 88-3735] p 646 A88-48986
- J**
- JAMMING**
Sukhoi Flanker
p 657 A88-48451
- JET AIRCRAFT NOISE**
Supersonic propulsion systems and community noise suppression concepts
[AIAA PAPER 88-2986] p 663 A88-46491
Prediction of propfan noise by a frequency-domain scheme
p 666 A88-49015
- JET ENGINE FUELS**
Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products
[DE88-010233] p 674 N88-26492
- JET ENGINES**
Theory and design of jet engines (Second revised and enlarged edition) --- Russian book
p 663 A88-46075
Performance limitations in parallel processor simulations
p 686 A88-49101
Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371
- JET EXHAUST**
Centerline Mach number characteristics of highly heated free jets
[AIAA PAPER 88-3612] p 642 A88-48898
- JET IMPINGEMENT**
Large-eddy simulations of axisymmetric excitation effects on a row of impinging jets
p 633 A88-46320
Heat transfer in an impinging circular jet with an inhomogeneous initial velocity profile
p 678 A88-48147
- JET LIFT**
Effect of vertical ejector-jet on the vortex-lift of delta wings
[AIAA PAPER 88-3842] p 640 A88-48840
- Numerical study of delta wing leading edge blowing
[NASA-CR-183101] p 650 N88-26335
- JET MIXING FLOW**
Enhanced mixing of supersonic jets
[AIAA PAPER 88-3002] p 634 A88-47071
Jet-wake thermal characteristics of heated turbulent jets in cross flow
[AIAA PAPER 88-3725] p 681 A88-48978
- K**
- KALMAN FILTERS**
Unsteady heat transfer coefficient estimation for long duration
p 675 A88-46181
A simulation study of a model reference adaptive control loading system for operational flight trainers
p 686 A88-46957
Analytical redundancy using band-limiting filters
p 668 A88-47931
- KARMAN VORTEX STREET**
Unsteady wing theory - The Karman/Sears legacy

- KEROSENE**
Antimisting kerosene: Low temperature degradation and blending
[NASA-CR-182725] p 675 N88-26495
- KIRCHHOFF LAW OF RADIATION**
Extension of Kirchhoff's formula to radiation from moving surfaces
p 687 A88-47670
- L**
- LABYRINTH SEALS**
Three-dimensional computation of rotordynamic force distributions in a labyrinth seal
[AIAA PAPER 88-3691] p 680 A88-48970
- LAMB WAVES**
The vortex rollup problem using Lamb vortices for the elliptically loaded wing
[AIAA PAPER 88-3746] p 640 A88-48843
- LAMINAR BOUNDARY LAYER**
Aerodynamic analysis of natural laminar flow airfoil
p 648 N88-25624
- LAMINAR FLOW**
Solution of coupled heat transfer problems in the case of flow past thermally thin bodies using the difference factorization method
p 678 A88-48146
Finite element analysis of incompressible viscous flow around multi-element airfoils
p 682 N88-25634
- LAMINAR FLOW AIRFOILS**
Design of low Reynolds number airfoils. II
[AIAA PAPER 88-3764] p 644 A88-48934
Calibration of averaging total pressure flight wake rake and natural-laminar-flow airfoil drag certification
[NASA-CR-181630] p 648 N88-25443
Aerodynamic analysis of natural laminar flow airfoil
p 648 N88-25624
- LAMINATES**
Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing
[NASA-CR-172519] p 658 N88-25452
- LANDING INSTRUMENTS**
MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988
p 653 A88-46251
- LANDING SIMULATION**
Application of frequency-domain handling qualities criteria to the longitudinal landing task
p 667 A88-46702
- LAPLACE EQUATION**
Prediction of oscillating thick cambered aerofoil aerodynamics by a locally analytic method
p 636 A88-47771
- LASER APPLICATIONS**
The circulation of an airfoil starting vortex obtained from instantaneous vorticity measurements over an area
[AIAA PAPER 88-3620] p 643 A88-48905
- LASER DOPPLER VELOCIMETERS**
Experimental investigation of three-dimensional forced mixer lobe flow fields
[AIAA PAPER 88-3785] p 666 A88-48997
- LASER GYROSCOPES**
A review of the mechanical design and development of a high performance accelerometer
p 677 A88-47047
- LASER OUTPUTS**
A twin-mirrored galvanometer laser light sheet generator
[NASA-TM-100587] p 683 N88-25901
- LATERAL STABILITY**
Computer analysis of the effect of the location of the vertical tail surface on the static lateral stability of a tailless aircraft
p 637 A88-48301
- LATTICES (MATHEMATICS)**
On non-linear vortex lattice method for wings at large angle of attack in steady, unsteady flow
p 636 A88-47475
- LEADING EDGE FLAPS**
Vortex-dominated slender-wing problems - Studies by a point-vortex method
[AIAA PAPER 88-3744] p 640 A88-48841
A low speed wind tunnel investigation of Reynolds number effects on a 60-deg swept wing configuration with leading and trailing edge flaps
[NASA-CR-181684] p 648 N88-25441
- LEADING EDGES**
Turbulence reduction on swept leading edges
p 632 A88-46249
Thickness noise of a propeller and its relation to blade sweep
p 687 A88-47060
Avanti- Pushing ahead to certification
p 657 A88-43458
Numerical study of delta wing leading edge blowing
[NASA-CR-183101] p 650 N88-26335
- LEAKAGE**
Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing
[NASA-CR-172519] p 658 N88-25452
- LIFE (DURABILITY)**
Assuring the durability and reliability of selected machine components in the surface-treatment process
p 678 A88-48150
- LIFE CYCLE COSTS**
Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371
- LIFT**
An explicit iterative method for determining the intensity of a wing vortex sheet
p 637 A88-48302
The circulation of an airfoil starting vortex obtained from instantaneous vorticity measurements over an area
[AIAA PAPER 88-3620] p 643 A88-48905
Calculation of lift-curve slope using a wing tip biased vortex distribution
p 647 A88-49022
- LIFT AUGMENTATION**
Effect of vertical ejector-jet on the vortex-lift of delta wings
[AIAA PAPER 88-3842] p 640 A88-48840
- LIFT DEVICES**
The identification of the direct lift control flap system of the research aircraft ATTAS
p 661 N88-26527
- LIFTING BODIES**
Aerodynamics of lifting bodies with combined transverse and longitudinal curvature
p 647 N88-25436
- LIGHT (VISIBLE RADIATION)**
A twin-mirrored galvanometer laser light sheet generator
[NASA-TM-100587] p 683 N88-25901
- LIGHT EMITTING DIODES**
The trick with light-emitting diodes - How to recognize a wing's aerodynamic quality at a glance
p 676 A88-46663
- LIGHTNING**
Aircraft jolts from lightning bolts
p 652 A88-48545
- LINEAR EQUATIONS**
Model reduction methods for control design
[NASA-CR-179434] p 687 N88-26144
- LINEAR PREDICTION**
Insights from linear predictions of aircraft response to damaged airfields
p 658 A88-49013
- LINEAR SYSTEMS**
Calculation of transonic flow about wing-body-fairing by a finite element method
p 635 A88-47255
- LIQUID ATOMIZATION**
Influence of design concept and liquid properties on fuel injector performance
p 675 A88-46226
- LIQUID CRYSTALS**
Liquid crystals for unsteady surface shear stress visualization
[AIAA PAPER 88-3841] p 643 A88-48908
- LOAD DISTRIBUTION (FORCES)**
Power radiated by an infinite plate subject to fluid loading and line drive
p 677 A88-47669
- LOBES**
Experimental investigation of three-dimensional forced mixer lobe flow fields
[AIAA PAPER 88-3785] p 666 A88-48997
- LONGITUDINAL CONTROL**
Application of frequency-domain handling qualities criteria to the longitudinal landing task
p 667 A88-46702
- LOOP ANTENNAS**
MSAT-X phased array antenna adaptations to airborne applications
p 683 N88-25713
- LOW ALTITUDE**
A low cost optical altimeter for RPV applications
p 663 A88-47199

LOW COST

Design and operation of low cost remotely-piloted aircraft for scientific field research p 656 A88-47184

LOW DENSITY MATERIALS

Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography p 676 A88-46826

LOW FREQUENCIES

Aircraft interior noise reduction by alternate resonance tuning [NASA-CR-182540] p 689 N88-26909

LOW REYNOLDS NUMBER

Validation of methods for the calculation of low-Reynolds-number hypersonic flow by wind tunnel tests

[AAAF PAPER NT-87-14] p 633 A88-46338
Design of low Reynolds number airfoils. II

[AIAA PAPER 88-3764] p 644 A88-48934

Aerodynamics forces on airfoils at high angles of attack

[AIAA PAPER 88-3696] p 645 A88-48973

LOW SPEED WIND TUNNELS

The wall pressure signature matrix method for solid wall interference correction of low-speed wind tunnel

[AAAF PAPER NT-87-14] p 633 A88-46338
Summary of low-speed wind tunnel results of several high-speed counterrotation propeller configurations

[AIAA PAPER 88-3149] p 638 A88-48758

Aerodynamics forces on airfoils at high angles of attack

[AIAA PAPER 88-3696] p 645 A88-48973

A low speed wind tunnel investigation of Reynolds number effects on a 60-deg swept wing configuration with leading and trailing edge flaps

[NASA-CR-181684] p 648 N88-25441

LOW TEMPERATURE

Antilimiting kerosene: Low temperature degradation and blending [NASA-CR-182725] p 675 N88-26495

M

MACH NUMBER

Steady Newtonian flow over two-dimensional airfoils p 631 A88-46047

Avanti- Pushing ahead to certification p 657 A88-48458

Centerline Mach number characteristics of highly heated free jets

[AIAA PAPER 88-3612] p 642 A88-48898

Transonic flow modes of an axisymmetric blunt body

[AIAA PAPER 88-3536] p 646 A88-49005

MACHINE TOOLS

Assuring the durability and reliability of selected machine components in the surface-treatment process p 678 A88-48150

MACHINING

Assuring the durability and reliability of selected machine components in the surface-treatment process p 678 A88-48150

MAGNETIC VARIATIONS

The development of a directional gyroscope for remotely piloted vehicles and similar applications p 662 A88-47030

MAN MACHINE SYSTEMS

Fallible humans and vulnerable systems - Lessons learned from aviation p 651 A88-46511

Project ROSAR - A high-resolution, all-weather visibility method for helicopters p 654 A88-46521

MAN POWERED AIRCRAFT

The Daedalus project - Physiological problems and solutions p 629 A88-46051

MANAGEMENT PLANNING

The challenges and opportunities of supersonic transport propulsion technology [AIAA PAPER 88-2985] p 665 A88-48032

Engine component retirement for cause. Volume 1: Executive summary [AD-A192730] p 667 N88-26371

MANIPULATORS

Use of LEBU-devices for drag reduction at flight conditions p 631 A88-46235

Drag reduction performance on riblet surfaces and through outer layer manipulators p 632 A88-46236

MARKET RESEARCH

An industry view of the future of MLS p 654 A88-46257

MARKOV PROCESSES

Semi-Markov adjunction to the Computer-Aided Markov Evaluator (CAME) [NASA-CR-181645] p 683 N88-25924

MATHEMATICAL MODELS

Introduction to hypersonic aerodynamics - Modeling problems

[AAAF PAPER NT-87-02] p 633 A88-46326

Dynamics and control of a gyroscopic force measuring system p 677 A88-47043

Assuring the durability and reliability of selected machine components in the surface-treatment process p 678 A88-48150

Use of MODEL equational specification - A case study in computational aerodynamics

[AIAA PAPER 88-3792] p 641 A88-48853

Numerical simulation of turbulent flow using the exponential expression of k-Epsilon equation

[AAAF PAPER NT-87-14] p 633 A88-46338

Semi-Markov adjunction to the Computer-Aided Markov Evaluator (CAME)

[NASA-CR-181645] p 683 N88-25924

Model reduction methods for control design

[NASA-CR-179434] p 687 N88-26144

A two-point aerodynamic model for identification

[AAAF PAPER NT-87-14] p 633 A88-46338

Utilization of identification methods in the time and frequency domain for the determination of the XV-15 (tilt-rotor) dynamics for lateral motion in hover flight

[AAAF PAPER NT-87-14] p 633 A88-46338

Aircraft interior noise reduction by alternate resonance tuning [NASA-CR-182540] p 689 N88-26909

MATHEMATICAL PROGRAMMING

Empirical relationships making it possible to reduce the number of design parameters in the optimization of wing panels

[AAAF PAPER NT-87-14] p 633 A88-46338

MAXIMUM LIKELIHOOD ESTIMATES

Parametric estimation of aerodynamic nonlinearities in rolling moment due to sideslip using maximum likelihood method

[AAAF PAPER NT-87-14] p 633 A88-46338

MECHANICAL OSCILLATORS

Oscillogro design, manufacture and performance p 662 A88-47032

MECHANICAL PROPERTIES

Electrically conducting plastics - New materials from aerospace research p 674 A88-48454

METAL BONDING

Influences of environment and stress history on the composite patch repair of cracked metallic structures

[AAAF PAPER NT-87-14] p 633 A88-46338

METAL CRYSTALS

A crystallographic model for nickel base single crystal alloys p 673 A88-48182

METAL FATIGUE

Fatigue crack growth at root radii in sheets with variable thickness p 677 A88-47004

METAL SHEETS

Fatigue crack growth at root radii in sheets with variable thickness p 677 A88-47004

METEOROLOGICAL RADAR

Use, nonuse, and abuse of weather radar p 685 A88-49018

METHODOLOGY

Methodology for analysis of afterbodies for three-dimensional aircraft configurations p 646 A88-49020

MICHIGAN

Aircraft accident report: Northwest Airlines, Inc., McDonnell Douglas DC-9-82, N312RC, Detroit Metropolitan Wayne County Airport, Romulus, Michigan, August 16, 1987

[PB88-910406] p 652 N88-25449

MICROBURSTS (METEOROLOGY)

Characteristics of microbursts in the continental United States p 685 A88-49037

Flight-management strategies for escape from microburst encounters

[NASA-TM-4057] p 669 N88-25461

Influence of wind shear on the aerodynamic characteristics of airplanes

[NASA-TP-2827] p 652 N88-26344

Control of flight through microburst wind shear using deterministic trajectory optimization p 670 N88-26375

MICROWAVE LANDING SYSTEMS

MLS - An operational and technical review; Proceedings of the Symposium, London, England, Feb. 9, 1988

[AAAF PAPER NT-87-14] p 633 A88-46338

MLS development and UK requirements --- for ILS-MLS transition planning at British airports p 653 A88-46252

The certification aspects of microwave landing systems - Airworthiness considerations p 651 A88-46253

UK MLS operational trials p 654 A88-46254

MLS: Operational benefits - The FAA viewpoint p 654 A88-46255

RAF plans for MLS p 654 A88-46256

An international airline's opinion --- on MLS capabilities p 654 A88-46258

The UK regional airline view --- on ILS-MLS transition problems p 654 A88-46259

Development of an airborne facility for advanced avionics research

[NLR-MP-87012-U] p 663 N88-26368

MIDAIR COLLISIONS

Application of team concept/systems approach to investigation of major mishaps p 651 A88-46508

Aircraft accident report: Midair collision of SkyWest Airlines Swearingen METRO 2, N163SW, and Mooney M20, N6485U, Kearns, Utah, January 15, 1987

[PB88-910404] p 653 N88-26346

MIG AIRCRAFT

Sukhoi Flanker p 657 A88-48451

MILITARY AIRCRAFT

RAF plans for MLS p 654 A88-46256

Materials trends in military airframes p 673 A88-46425

Future flight simulation - A military view p 671 A88-46429

Performance evaluation of a two dimensional convergent-divergent ejector exhaust system

[AIAA PAPER 88-2999] p 663 A88-46492

The High Technology Test Bed program p 657 A88-48453

Aircraft field degradation and electromagnetic compatibility [PB88-183975] p 663 N88-25456

MILITARY HELICOPTERS

Helicopter vibration control in the Fleet Air Arm p 656 A88-46266

Army experience with Lynx head absorber p 656 A88-46269

Helicopter transmission fatigue life estimation p 658 A88-49021

MILITARY OPERATIONS

High G and high G protection - The operational scenario p 629 A88-46202

MIRRORS

A twin-mirrored galvanometer laser light sheet generator [NASA-TM-100587] p 683 N88-25901

MISSION PLANNING

Flight Mechanics Panel Symposium on Rotorcraft Design for Operations: Technical evaluation report [AGARD-AR-243] p 659 N88-26362

MIXING LENGTH FLOW THEORY

Instabilities in the wake/mixing-layer region of a splitter plate separating two supersonic streams

[AIAA PAPER 88-3677] p 643 A88-48911

MOBILE COMMUNICATION SYSTEMS

World-wide aeronautical satellite communications p 682 N88-25688

MSAT-X phased array antenna adoptions to airborne applications p 683 N88-25713

Development of an 8000 bps voice codec for AvSat p 683 N88-25755

MODEL REFERENCE ADAPTIVE CONTROL

A simulation study of a model reference adaptive control loading system for operational flight trainers p 686 A88-46957

MODELS

Computerized life and reliability modelling for turboprop transmissions

[AIAA PAPER 88-2979] p 673 A88-48031

F-14 modeling study [NASA-CR-4164] p 669 N88-25462

MOMENTS OF INERTIA

A new method for the estimation of aircraft inertia characteristics p 661 N88-26530

MOTION STABILITY

Steady-state motions of a heavy axisymmetric body in a medium with drag --- aerodynamic effects on parachute descent p 634 A88-46894

MYOCARDIAL INFARCTION

Aircraft accident report: Joe Foster Excavating, Inc., Bell 206B, N49606, in-flight collision with trees, Alamo, California, August 3, 1986

[PB88-910405] p 653 N88-26345

Aircraft accident report: Northwest Airlines, Inc., McDonnell Douglas DC-9-82, N312RC, Detroit Metropolitan Wayne County Airport, Romulus, Michigan, August 16, 1987
[PB88-910406] p 652 N88-25449
- PILOT PERFORMANCE**
Acceptance procedures to improve the handling fidelity of military flight simulators p 672 A88-46438
Aircraft accident report: Joe Foster Excavating, Inc., Bell 206B, N49606, in-flight collision with trees, Alamo, California, August 3, 1986
[PB88-910405] p 653 N88-26345
Aircraft accident report: Midair collision of SkyWest Airlines Swearingen METRO 2, N163SW, and Mooney M20, N6485U, Kearns, Utah, January 15, 1987
[PB88-910404] p 653 N88-26346
Control of flight through microburst wind shear using deterministic trajectory optimization p 670 N88-26375
Computer simulation of a single pilot flying a modern high-performance helicopter
[NASA-TM-100182] p 670 N88-26376
Computer simulation of multiple pilots flying a modern high performance helicopter
[NASA-TM-100183] p 670 N88-26377
Flight simulator: Field of view utilized in performing tactical maneuvers
[AD-A192412] p 672 N88-26379
- PILOT TRAINING**
The acquisition and use of flight simulation technology in aviation training; Proceedings of the International Conference, London, England, Apr. 27-29, 1987. Volumes 1 & 2 p 671 A88-46427
Acceptance procedures to improve the handling fidelity of military flight simulators p 672 A88-46438
Event-driven versus interrupt-driven flight simulation methodologies p 686 A88-46979
Intelligent guidance and control for wind shear encounter
[NASA-CR-183060] p 653 N88-26347
- PIPE FLOW**
Measurement and prediction of rough wall effects on friction factor - Uniform roughness results
[AIAA PAPER 88-3754] p 680 A88-48926
- PITCHING MOMENTS**
Visualizing the connectivity of vortex systems for pitching wings
[AIAA PAPER 88-3549] p 679 A88-48860
Unsteady aerodynamics of an airfoil in combined translation/pitch oscillations below and through stall
[AIAA PAPER 88-3540] p 641 A88-48873
- PLASTIC AIRCRAFT STRUCTURES**
Electrically conducting plastics - New materials from aerospace research p 674 A88-48454
- PLASTICS**
Electrically conducting plastics - New materials from aerospace research p 674 A88-48454
- POROUS BOUNDARY LAYER CONTROL**
Comparison of experimental and theoretical results concerning the effect of air suction on the aerodynamic characteristics of a wing p 637 A88-48312
- POTENTIAL FLOW**
The asymmetric pair of vortices adjacent to a spinning cylinder - A small perturbation solution p 635 A88-47263
Transonic potential flow calculations by two artificial density methods p 635 A88-47456
On the order of panel methods
[AIAA PAPER 88-3798] p 641 A88-48858
Two complementary approaches to transonic potential flow about oscillating airfoils p 646 A88-49010
- Improved potential flow computational methods with Euler corrections for airfoil and wing/body design
[AD-A192303] p 650 N88-26334
Calculation of 2-D unsteady transonic full potential flow about oscillating airfoils by two complementary approaches
[PB88-127519] p 651 N88-26341
- POWERED LIFT AIRCRAFT**
Takeoff predictions for powered-lift aircraft
[NASA-CR-177491] p 630 N88-25431
- PRANDTL NUMBER**
Ludwig Prandtl collected treatises on applied mechanics, hydro- and aerodynamics, part 1
[NASA-TT-20316] p 650 N88-26337
Ludwig Prandtl collected treatises on applied mechanics, hydro- and aerodynamics, part 2, IV interfaces and resistance
[NASA-TT-20315] p 651 N88-26338
- PREDICTIONS**
Takeoff predictions for powered-lift aircraft
[NASA-CR-177491] p 630 N88-25431
Prediction of fatigue life of notched specimens under aircraft loading and importance of the relative method in the case of local strain approach, part 2
[TAE-595-PT-2] p 684 A88-25934
Intelligent guidance and control for wind shear encounter
[NASA-CR-183060] p 653 N88-26347
- PRESSURE DISTRIBUTION**
Surface pressure fluctuations due to impinging vortical flows upon an airfoil
[AIAA PAPER 88-3657] p 639 A88-48816
Mode switching in supersonic circular jets
[AIAA PAPER 88-3610] p 687 A88-48896
- PRESSURE GRADIENTS**
On cone frustum pressure gradient effects on transition p 636 A88-47470
Three-dimensional perturbation evolution in a boundary layer with a pressure gradient p 636 A88-48131
- PRESSURE MEASUREMENT**
A preliminary investigation of unsteady pressure measurement on a two-dimensional wing model
Calibration of averaging total pressure flight wake rake and natural-laminar-flow airfoil drag certification
[NASA-CR-181630] p 648 N88-25443
- PRESSURE OSCILLATIONS**
Study of the reduction of friction and pressure fluctuations downstream of 'aviation profile'-type manipulators in tandem
[AAAF PAPER NT-87-20] p 634 A88-46344
- PRESSURE VESSELS**
A two degree of freedom gyroscope with frictionless inner and outer gimbal pick-offs p 662 A88-47031
- PROBLEM SOLVING**
An initial investigation into methods of computing transonic aerodynamic sensitivity coefficients
[NASA-CR-183061] p 650 N88-26332
- PRODUCT DEVELOPMENT**
Automated machining of complex parts and tools - A design-driven manufacturing initiative p 679 A88-48452
- PROJECTILES**
Numerical computations of transonic critical aerodynamic behavior
[AIAA PAPER 88-4038] p 639 A88-48832
- PROP-FAN TECHNOLOGY**
PTA flight test overview --- Propfan Test Assessment
[AIAA PAPER 88-2803] p 657 A88-48025
Prediction of propfan noise by a frequency-domain scheme p 666 A88-49015
Propfan test assessment testbed aircraft stability and control/performance 1/9-scale wind tunnel tests
[NASA-CR-182121] p 659 N88-26360
- PROPELLER BLADES**
Thickness noise of a propeller and its relation to blade sweep p 687 A88-47060
Aerodynamic interaction tones of a model counter-rotating propeller p 687 A88-47469
- PROPELLER EFFICIENCY**
Summary of low-speed wind tunnel results of several high-speed counterrotation propeller configurations
[AIAA PAPER 88-3149] p 638 A88-48758
Navier-Stokes analysis of the performance and flow field of single and counter-rotation propellers
[AIAA PAPER 88-3638] p 645 A88-48961
- PROPELLERS**
Numerical Navier-Stokes solutions of high-speed propeller flows p 631 A88-46214
Experimental and numerical investigation of a propeller with three-dimensional inflow p 631 A88-46221
Extension of Kirchhoff's formula to radiation from moving surfaces p 687 A88-47670
Numerical solutions of the Euler equations for the flow field around counter-rotating propellers p 649 N88-25638
- PROPULSION SYSTEM CONFIGURATIONS**
The challenges and opportunities of supersonic transport propulsion technology
[AIAA PAPER 88-2985] p 665 A88-48032
- PROPULSION SYSTEM PERFORMANCE**
An engineering model for analysis of scramjet combustor performance with finite rate chemistry
[AIAA PAPER 88-3258] p 664 A88-46501
PTA flight test overview --- Propfan Test Assessment
[AIAA PAPER 88-2803] p 657 A88-48025
- PROPULSIVE EFFICIENCY**
Overview of flight testing of GE aircraft engines' UDF engine --- Un-Ducted Fan
[AIAA PAPER 88-3082] p 664 A88-46495
- PROTECTIVE COATINGS**
Corrosion prevention in gas turbines
[NLR-MP-87029-U] p 667 N88-26373
- PULSE RADAR**
Simulation of clutter return for an airborne pulse Doppler radar p 662 A88-46965

R

RADAR ANTENNAS

Simulation of clutter return for an airborne pulse Doppler radar p 662 A88-46965

RADAR DATA

Use, nonuse, and abuse of weather radar p 685 A88-49018

RADAR SCANNING

Simulation of an air-to-air tracking system for an electronically steered antenna p 662 A88-46970

RADAR TRACKING

Simulation of an air-to-air tracking system for an electronically steered antenna p 662 A88-46970
Sukhoi Flanker p 657 A88-48451

RADIO CONTROL

Frequency domain identification of the dynamics of a scaled remotely-piloted helicopter p 670 N88-26524

RADIO FREQUENCY INTERFERENCE

Aircraft field degradation and electromagnetic compatibility
[PB88-183975] p 663 N88-25456

RAKES

Calibration of averaging total pressure flight wake rake and natural-laminar-flow airfoil drag certification
[NASA-CR-181630] p 648 N88-25443

RAMJET ENGINES

Multi-step dump combustor design to reduce combustion instabilities
[AIAA PAPER 88-2854] p 665 A88-48029
An efficient computational tool for ramjet combustor research
[DE88-010034] p 666 N88-26369

RANDOM LOADS

Prediction of fatigue life of notched specimens under aircraft loading and importance of the relative method in the case of local strain approach, part 2
[TAE-595-PT-2] p 684 N88-25934

RAREFIED GAS DYNAMICS

Physicochemical nonequilibrium effects in hypersonic flows
[AAAF PAPER NT-87-05] p 633 A88-46329
Rarefied gas numerical wind tunnel 3. Universal code for three dimensional bodies p 649 N88-25644

REACTION KINETICS

An engineering model for analysis of scramjet combustor performance with finite rate chemistry
[AIAA PAPER 88-3258] p 664 A88-46501

REAL TIME OPERATION

Event-driven versus interrupt-driven flight simulation methodologies p 686 A88-46979
A high fidelity real-time simulation of a small turboshaft engine
[NASA-TM-100991] p 670 N88-26378

REATTACHED FLOW

Structure of a reattaching supersonic shear flow
[AIAA PAPER 88-3615] p 643 A88-48901

RECTANGULAR PLANFORMS

The determination of the topological structure of skin friction lines on a rectangular wing-body combination
[NASA-CR-4168] p 651 N88-26343

RECTANGULAR WINGS

Visualizing the connectivity of vortex systems for pitching wings
[AIAA PAPER 88-3549] p 679 A88-48860
Calculation of lift-curve slope using a wing tip biased vortex distribution p 647 A88-49022

REDUCED GRAVITY

Reduced gravity boiling and condensing experiments simulated with the COBRA/TRAC computer code
[AIAA PAPER 88-3634] p 680 A88-48958

REDUNDANCY

Analytical redundancy using band-limiting filters p 668 A88-47931

REFINING

Feasibility of producing jet fuel from GPGP (Great Plains Gasification Plant) by-products
[DE88-010233] p 674 N88-26492

RELIABILITY

Computerized life and reliability modelling for turboprop transmissions
[AIAA PAPER 88-2979] p 673 A88-48031
Assuring the durability and reliability of selected machine components in the surface-treatment process
p 678 A88-48150

RELIABILITY ANALYSIS

Semi-Markov adjunction to the Computer-Aided Markov Evaluator (CAME)
[NASA-CR-181645] p 683 N88-25924

REMOTELY PILOTED VEHICLES

The development of a directional gyroscope for remotely piloted vehicles and similar applications
p 662 A88-47030

Remotely piloted vehicles; Proceedings of the Sixth International Conference, Bristol, England, Apr. 6-8, 1987, Conference Papers and Supplementary Papers
p 656 A88-47183

Design and operation of low cost remotely-piloted aircraft for scientific field research p 656 A88-47184
UMMA - Doing it differently --- Un-Manned Micro-Aircraft p 657 A88-47187
Auxiliary electrical power sources for unmanned aircraft p 665 A88-47189
Compact electromechanical actuation for high performance RPV flight control p 667 A88-47191
Beacon navigation p 654 A88-47194
A low cost optical altimeter for RPV applications p 663 A88-47199

RESCUE OPERATIONS

Project ROSAR - A high-resolution, all-weather visibility method for helicopters p 654 A88-46521

RESEARCH AIRCRAFT

The identification of the direct lift control flap system of the research aircraft ATTAS p 661 N88-26527

RESEARCH AND DEVELOPMENT

Turbulent drag reduction research at NASA Langley - Progress and plans p 631 A88-46228

RESEARCH MANAGEMENT

Flight research and testing
[NASA-TM-100439] p 659 N88-26361

RESONANCE

Aircraft interior noise reduction by alternate resonance tuning
[NASA-CR-182540] p 689 N88-26909

RETIREMENT FOR CAUSE

Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371

REYNOLDS NUMBER

A low speed wind tunnel investigation of Reynolds number effects on a 60-deg swept wing configuration with leading and trailing edge flaps
[NASA-CR-181684] p 648 N88-25441

RIBS (SUPPORTS)

Damage tolerance of a composite multirib wing box
p 657 A88-47213

RIGID STRUCTURES

Flutter modes of high aspect ratio tailless aircraft
p 669 A88-49023

RING LASERS

A review of the mechanical design and development of a high performance accelerometer
p 677 A88-47047

ROBUSTNESS (MATHEMATICS)

Large motion robust flight control of aircraft by equivalent nonlinear elimination p 667 A88-46049
Analysis of the technique of robust eigenstructure assignment with application to aircraft control p 668 A88-47932

ROLLING MOMENTS

Parametric estimation of aerodynamic nonlinearities in rolling moment due to sideslip using maximum likelihood method p 661 N88-26528

ROTOR WING AIRCRAFT

Zero/zero rotorcraft certification issues. Volume 1: Executive summary
[NASA-CR-177483-VOL-1] p 658 N88-25453

Zero/zero rotorcraft certification issues. Volume 2: Plenary session presentations
[NASA-CR-177483-VOL-2] p 659 N88-25454

Zero/zero rotorcraft certification issues. Volume 3: Working group results
[NASA-CR-177483-VOL-3] p 659 N88-25455

Hover performance tests of baseline metal and Advanced Technology Blade (ATB) rotor systems for the XV-15 tilt rotor aircraft
[NASA-CR-177436] p 660 N88-26367

A general-purpose approach to computer-aided dynamic analysis of a flexible helicopter
[NASA-TM-101002] p 685 N88-26709

ROTARY WINGS

Helicopter vibration - Its origin and methods of control
p 655 A88-46261

Some aspects of automatic speech recognition under helicopter vibration p 654 A88-46263

Diagnostics - An efficient methodology for rotor track and balance p 629 A88-46267

Vibration control at RAF Odiham p 656 A88-46268

Blade design, higher harmonic pitch and active structural response control for helicopter vibration minimisation p 656 A88-46270

Titanium alloys in helicopter rotor head designs
p 673 A88-46424

Prediction of helicopter rotor discrete frequency noise for three scale models p 688 A88-49014

Grid generation of a helicopter rotary-wing
p 649 N88-25665

Helicopter main-rotor noise: Determination of source contributions using scaled model data
[NASA-TP-2825] p 689 N88-26907

ROTATING CYLINDERS

The asymmetric pair of vortices adjacent to a spinning cylinder - A small perturbation solution
p 635 A88-47263

ROTATING FLUIDS

Flow visualization in a 90 degree bifurcation
[AIAA PAPER 88-3551] p 680 A88-48862

ROTOR AERODYNAMICS

Calculation of unsteady wake/rotor interaction
p 631 A88-46223

Titanium alloys in helicopter rotor head designs
p 673 A88-46424

Periodic rotor blade aerodynamics including loading effects
[AIAA PAPER 88-3639] p 645 A88-48962

Three dimensional finite element analysis for aerodynamic design of fan blades
[AIAA PAPER 88-3641] p 645 A88-48964

Three-dimensional computation of rotordynamic force distributions in a labyrinth seal
[AIAA PAPER 88-3691] p 680 A88-48970

An efficient patched grid Navier-Stokes solution procedure for multiple bodies --- rotor blade configurations
[AIAA PAPER 88-3559] p 681 A88-49004

Research investigation of helicopter main rotor/tail rotor interaction noise
[NASA-CR-4143] p 688 N88-26165

ROTOR BLADES

Equipment for studying the thermal stressed state of rotating gas turbine components p 678 A88-48148

Periodic rotor blade aerodynamics including loading effects
[AIAA PAPER 88-3639] p 645 A88-48962

Interaction mechanisms between tip leakage flow and the passage vortex in a linear turbine rotor cascade
p 647 A88-49178

Hover performance tests of baseline metal and Advanced Technology Blade (ATB) rotor systems for the XV-15 tilt rotor aircraft
[NASA-CR-177436] p 660 N88-26367

ROTOR BLADES (TURBOMACHINERY)

Experimental vibration damping characteristics of the third-stage rotor of a three-stage transonic axial-flow compressor
[AIAA PAPER 88-3229] p 666 A88-48759

The effect of forward skewed rotor blades on aerodynamic and aeroacoustic performance of axial-flow fan
[AIAA PAPER 88-3783] p 688 A88-48996

An efficient patched grid Navier-Stokes solution procedure for multiple bodies --- rotor blade configurations
[AIAA PAPER 88-3559] p 681 A88-49004

ROTOR BODY INTERACTIONS

A study of the encounter between a helical vortex and a circular cylinder
[AIAA PAPER 88-3622] p 643 A88-48906

ROTORCRAFT AIRCRAFT

The role of aviation technology in the Caribbean Basin
[NASA-CR-183069] p 630 N88-26289

ROTORS

Extension of Kirchhoff's formula to radiation from moving surfaces p 687 A88-47670

Improved method for stress and compatibility analysis of multicomponent rotating systems
[NASA-TM-100884] p 684 N88-25935

RUNWAY CONDITIONS

Insights from linear predictions of aircraft response to damaged airfields p 658 A88-49013

RUNWAYS

Takeoff predictions for powered-lift aircraft
[NASA-CR-177491] p 630 N88-25431

SAFETY FACTORS

Control of flight through microburst wind shear using deterministic trajectory optimization p 670 N88-26375

SCALE MODELS

A preliminary investigation of unsteady pressure measurement on a two-dimensional wing model
p 630 A88-45934

Frequency domain identification of the dynamics of a scaled remotely-piloted helicopter p 670 N88-26524

SCHEDULING

Airport load leveling by activity analysis
p 652 A88-46373

SCHLIEREN PHOTOGRAPHY

Mode switching in supersonic circular jets
[AIAA PAPER 88-3610] p 687 A88-48396

SEALS (STOPPERS)

Effective use of buffer gas sleeve-type seals in centrifugal compressors p 677 A88-47566

SEPARATED FLOW

Numerical study of incompressible viscous flow over an isolated airfoil p 630 A88-45930

Asymptotic theory of separated flows --- Russian book p 675 A88-46060

A study of nonstationary separated flows over depressions p 637 A88-48143

Aircraft vortices - Juncture, wing, and wake
[AIAA PAPER 88-3742] p 640 A88-48839

Unsteady separation over maneuvering bodies --- perturbed aerodynamics of flying aircraft
[AIAA PAPER 88-3542] p 642 A88-48875

Transonic shock/boundary-layer interaction studies - Asymptotic theories, numerical solutions, and the role of turbulence modeling
[AIAA PAPER 88-3800] p 644 A88-48936

Analysis of symmetric wake behind a circular cylinder using a direct solution technique and Newton's method
[AIAA PAPER 88-3608] p 645 A88-48942

Trailing edge flows and aerodynamic sound
[AIAA PAPER 88-3826] p 688 A88-48002

Treatment of the separated flow around profiles (nonviscous, incompressible, two dimensional flow) by the singularities method
[ISL-R-106/87] p 684 N88-26633

SERVICE LIFE

Calculation of aircraft fatigue and damage tolerance
p 657 A88-48471

Commercial aircraft structure fatigue - Analysis of expected in-service loading and the prediction of structural component behavior
p 658 A88-48472

Engine component retirement for cause. Volume 1: Executive summary
[AD-A192730] p 667 N88-26371

SERVOCONTROL

Large motion robust flight control of aircraft by equivalent nonlinear elimination p 667 A88-46049

SHARP LEADING EDGES

Comparison of experimental and numerical results for delta wings with vortex flaps p 646 A88-49012

Computation of vortical interaction for a sharp-edged double-delta wing p 646 A88-49017

SHEAR FLOW

Measurements of turbulent flow behind a wing-body junction p 635 A88-47467

Structure of a reattaching supersonic shear flow
[AIAA PAPER 88-3615] p 643 A88-48901

Influence of wind shear on the aerodynamic characteristics of airplanes
[NASA-TP-2827] p 652 N88-26344

SHEAR STRESS

Analytic and analogue techniques for determining potential distributions around angled cracks
p 677 A88-47686

Liquid crystals for unsteady surface shear stress visualization
[AIAA PAPER 88-3841] p 643 A88-48908

SHOCK LAYERS

Fluid dynamic modeling and numerical simulation of low-density hypersonic flow
[AIAA PAPER 88-2731] p 678 A88-47993

SHOCK TUNNELS

Test methods in hypersonics
[AAAF PAPER NT-87-09] p 671 A88-46333

SHOCK WAVE INTERACTION

The interaction between normal shock and turbulent boundary layer in transonic flow over a curved wall
p 630 A88-45936

Prediction of the aerodynamic coefficients of hypersonic vehicles using the HARP and SHARP codes - Comparison with experimental results
[AAAF PAPER NT-87-13] p 633 A88-46337

Fundamental experiments on the passive control of the transonic shock/boundary-layer interaction
[AAAF PAPER NT-87-17] p 634 A88-46341

SHOCK WAVES

- Upstream influence and separation scales in fin-induced shock turbulent boundary-layer interaction p 636 A88-47963
- Passive control plate for shock-boundary layer interactions [AIAA PAPER 88-3537] p 641 A88-48870
- Navier-Stokes solutions of transonic nozzle flow with shock-induced flow separations [AIAA PAPER 88-3614] p 643 A88-48900
- Transonic shock/boundary-layer interaction studies - Asymptotic theories, numerical solutions, and the role of turbulence modeling [AIAA PAPER 88-3800] p 644 A88-48936
- Characteristics of multiple shock wave/turbulent boundary layer interactions in rectangular ducts [AIAA PAPER 88-3803] p 644 A88-48937
- SHOCK WAVES**
- Steady Newtonian flow over two-dimensional airfoils p 631 A88-46047
- A study of nonstationary separated flows over depressions p 637 A88-48143
- On the use of an implicit procedure to accelerate convergence of full pseudospectral solutions to the Navier-Stokes equations of motion for flows with shock waves [AIAA PAPER 88-3644] p 679 A88-48805
- SHORT CRACKS**
- Analytic and analogue techniques for determining potential distributions around angled cracks p 677 A88-47686
- SHORT HAUL AIRCRAFT**
- Current fire safety design aspects of commuter aircraft [DOT/FAA/CT-87/32] p 652 N88-25448
- SHORT TAKEOFF AIRCRAFT**
- A numerical study of the hot gas environment around a STOLV aircraft in ground proximity [AIAA PAPER 88-2888] p 665 A88-48752
- Takeoff predictions for powered-lift aircraft [NASA-CR-177491] p 630 N88-25431
- Low-speed wind-tunnel test of a STOL supersonic-cruise fighter concept [NASA-TM-4050] p 669 N88-26374
- SIDESLIP**
- Parametric estimation of aerodynamic nonlinearities in rolling moment due to sideslip using maximum likelihood method p 661 N88-26528
- SIGNAL FADING**
- Performance of the ICAO standard core service modulation and coding techniques p 683 N88-25723
- SIMULATION**
- Numerical simulation of turbulent flow using the exponential expression of k-Epsilon equation p 682 N88-25662
- Simulated measurement of power flow in structures near to simple sources and simple boundaries [NASA-TM-89124] p 688 N88-26166

- Jet-wake thermal characteristics of heated turbulent jets in cross flow
[AIAA PAPER 88-3725] p 681 A88-48978
- WATER TUNNEL TESTS**
- Measurement and prediction of rough wall effects on friction factor - Uniform roughness results
[AIAA PAPER 88-3754] p 680 A88-48926
- WAVE DEGRADATION**
- Aircraft field degradation and electromagnetic compatibility
[PB88-183975] p 663 N88-25456

WAVE DRAG

The effect of contour deformation on the wave drag of a thin airfoil p 637 A88-48303

WAVE PACKETS

Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing p 638 A88-48746

WAVE PROPAGATION

A study of nonstationary separated flows over depressions p 637 A88-48143

WEATHER FORECASTING

Use, nonuse, and abuse of weather radar p 685 A88-49018

WEIGHT REDUCTION

Ceramics fire the future p 674 A88-48455

WIND SHEAR

Gamma guidance schemes for flight in a windshear p 667 A88-46707

Characteristics of microbursts in the continental United States p 685 A88-49037

Quasi-steady flight to quasi-steady flight transition for abort landing in a windshear - Trajectory optimization and guidance p 669 A88-49198

Flight-management strategies for escape from microburst encounters

[NASA-TM-4057] p 669 N88-25461

Influence of wind shear on the aerodynamic characteristics of airplanes

[NASA-TP-2827] p 652 N88-26344

Intelligent guidance and control for wind shear encounter

[NASA-CR-183060] p 653 N88-26347

WIND TUNNEL APPARATUS

The trick with light-emitting diodes - How to recognize a wing's aerodynamic quality at a glance p 676 A88-46663

WIND TUNNEL CALIBRATION

The wall pressure signature matrix method for solid wall interference correction of low-speed wind tunnel p 671 A88-45931

WIND TUNNEL DRIVES

Test methods in hypersonics [AAAF PAPER NT-87-09] p 671 A88-46333

WIND TUNNEL TESTS

The application of colour helium bubble in the wind tunnel test p 671 A88-45933

Test methods in hypersonics

[AAAF PAPER NT-87-09] p 671 A88-46333

Flow around and downstream of pointed or blunt yawed cones in a Mach 7 or 5 stream

[AAAF PAPER NT-87-10] p 633 A88-46334

Methods for measuring convection flux in the R2 and R3 wind tunnels at Chalais-Meudon - Current implementation and future developments

[AAAF PAPER NT-87-11] p 676 A88-46335

Validation of methods for the calculation of low-Reynolds-number hypersonic flow by wind tunnel tests

[AAAF PAPER NT-87-14] p 633 A88-46338

Fundamental experiments on the passive control of the transonic shock/boundary-layer interaction

[AAAF PAPER NT-87-17] p 634 A88-46341

Enhanced mixing of supersonic jets

[AIAA PAPER 88-3002] p 634 A88-47071

Measurements of turbulent flow behind a wing-body junction p 635 A88-47467

Filling the expertise gap --- aeroservoelasticity, structures, stability and control design of aerospace vehicles p 668 A88-48495

Summary of low-speed wind tunnel results of several high-speed counterrotation propeller configurations

[AIAA PAPER 88-3149] p 638 A88-48758

Mode switching in supersonic circular jets

[AIAA PAPER 88-3610] p 687 A88-48896

Structure of a reattaching supersonic shear flow

[AIAA PAPER 88-3615] p 643 A88-48901

A study of the encounter between a helical vortex and a circular cylinder

[AIAA PAPER 88-3622] p 643 A88-48906

Comparison of experimental and numerical results for delta wings with vortex flaps p 646 A88-49012

Divergence study of a high-aspect-ratio, forward swept wing p 658 A88-49025

Wind tunnel wall interference (January 1980 - May 1988):

A selected, annotated bibliography

[NASA-TM-4061] p 672 N88-25466

Propfan test assessment testbed aircraft stability and control/performance 1/9-scale wind tunnel tests

[NASA-CR-182121] p 659 N88-26360

Low-speed wind-tunnel test of a STOL supersonic-cruise fighter concept

[NASA-TM-4050] p 669 N88-26374

Helicopter main-rotor noise: Determination of source contributions using scaled model data

[NASA-TP-2825] p 689 N88-26907

WIND TUNNEL WALLS

The wall pressure signature matrix method for solid wall interference correction of low-speed wind tunnel

p 671 A88-45931

Empty test section streamlining of the transonic self-streamlining wind tunnel fitted with new walls [NASA-CR-181680] p 648 N88-25442

Wind tunnel wall interference (January 1980 - May 1988):

A selected, annotated bibliography

[NASA-TM-4061] p 672 N88-25466

Wall interference assessment/correction of data from tests of a CAST 10-2/DOA 2 airfoil in the Langley 0.3-m transonic cryogenic tunnel p 650 N88-26331

WIND TUNNELS

Rarefied gas numerical wind tunnel 3. Universal code for three dimensional bodies p 649 N88-25644

WING FLOW METHOD TESTS

Divergence study of a high-aspect-ratio, forward swept wing p 658 A88-49025

WING LOADING

Damage tolerance of a composite multirib wing box p 657 A88-47213

The vortex rollup problem using Lamb vortices for the elliptically loaded wing [AIAA PAPER 88-3746] p 640 A88-48843

Euler calculations for wing-alone configuration p 646 A88-49016

Spanwise displacement of a line vortex above a wing - A simple calculation scheme p 647 A88-49024

WING OSCILLATIONS

Helicopter vibration - Its origin and methods of control p 655 A88-46261

Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing p 638 A88-48746

Unsteady wing theory - The Karman/Sears legacy [AIAA PAPER 88-3539] p 641 A88-48872

Flutter prediction involving trailing-edge control surfaces p 669 A88-49009

Two complementary approaches to transonic potential flow about oscillating airfoils p 646 A88-49010

Flutter modes of high aspect ratio tailless aircraft p 669 A88-49023

WING PANELS

Comparison of experimental and theoretical results concerning the effect of air suction on the aerodynamic characteristics of a wing p 637 A88-48312

Empirical relationships making it possible to reduce the number of design parameters in the optimization of wing panels p 678 A88-48315

WING PROFILES

An improved technique for the solution of inviscid transonic 3D flows p 634 A88-47252

A new robust 3-D transonic wing design program utilizing Dirichlet-type boundary conditions p 635 A88-47258

Design of low Reynolds number airfoils. II [AIAA PAPER 88-3764] p 644 A88-48934

Improved potential flow computational methods with Euler corrections for airfoil and wing/body design [AD-A192303] p 650 N88-26334

WING TANKS

Fuel containment and damage tolerance in large composite primary aircraft structures. Phase 2: Testing [NASA-CR-172519] p 658 N88-25452

WING TIP VORTICES

A study of the encounter between a helical vortex and a circular cylinder

[AIAA PAPER 88-3622] p 643 A88-48906

WING TIPS

Calculation of lift-curve slope using a wing tip biased vortex distribution p 647 A88-49022

Spanwise displacement of a line vortex above a wing - A simple calculation scheme p 647 A88-49024

WINGS

A preliminary investigation of unsteady pressure measurement on a two-dimensional wing model p 630 A88-45934

The trick with light-emitting diodes - How to recognize a wing's aerodynamic quality at a glance p 676 A88-46663

On non-linear vortex lattice method for wings at large angle of attack in steady, unsteady flow p 636 A88-47475

On the stationary solutions of three-dimensional Euler equations by the TVD difference schemes p 682 N88-25660

Numerical simulation of turbulent flow using the exponential expression of k-Epsilon equation p 682 N88-25662

X**X RAY ANALYSIS**

Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography p 676 A88-46826

XV-15 AIRCRAFT

Hover performance tests of baseline metal and Advanced Technology Blade (ATB) rotor systems for the XV-15 tilt rotor aircraft

[NASA-CR-177436] p 660 N88-26367

Utilization of identification methods in the time and frequency domain for the determination of the XV-15 (tilt-rotor) dynamics for lateral motion in hover flight p 661 N88-26532

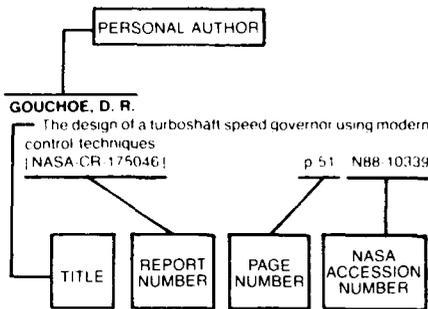

Y**YAW**

Flutter suppression within reach p 668 A88-48494

YAWING MOMENTS

Development of a three-dimensional perturbation wave packet in the boundary layer of a yawed wing p 638 A88-48746

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document listed (e.g., NASA report, translation, NASA contractor report). The page and accession numbers are located beneath and to the right of the title. Under any one author's name the accession numbers are arranged in sequence with the AIAA accession numbers appearing first.

A

- ABDEL-HAMID, A. N.**
Unsteady flow in a centrifugal compressor with different types of vane diffusers
[ASME PAPER 88-GT-22] p 681 A88-49176

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the abstract in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

FOREIGN TECHNOLOGY INDEX

AERONAUTICAL ENGINEERING / A Continuing Bibliography (Supplement 232)

November 1988

Typical Foreign Technology Index Listing

Listings in this index are arranged alphabetically by country of intellectual origin. The title of the document is used to provide a brief description of the subject matter. The page number and the accession number are included in each entry to assist the user in locating the citation in the abstract section. If applicable, a report number is also included as an aid in identifying the document.

A

AUSTRALIA

Helicopter transmission fatigue life estimation
p 658 A88-49021

C

CANADA

Simulation data validation system developed
p 671 A88-46272

Influences of environment and stress history on the composite patch repair of cracked metallic structures
p 675 A88-46323

Calculation of lift-curve slope using a wing tip biased vortex distribution
p 647 A88-49022

Performance of the ICAO standard core service modulation and coding techniques
p 683 N88-25723

CHINA, PEOPLE'S REPUBLIC OF

The highly accurate convective difference schemes
p 675 A88-45929

Numerical study of incompressible viscous flow over an isolated airfoil
p 630 A88-45930

The wall pressure signature matrix method for solid wall interference correction of low-speed wind tunnel
p 671 A88-45931

The application of colour helium bubble in the wind tunnel test
p 671 A88-45933

A preliminary investigation of unsteady pressure measurement on a two-dimensional wing model
p 630 A88-45934

The interaction between normal shock and turbulent boundary layer in transonic flow over a curved wall
p 630 A88-45936

Numerical calculation for the flow field of transonic cascade with inviscid-viscous interaction method
p 630 A88-45937

On non-linear vortex lattice method for wings at large angle of attack in steady, unsteady flow
p 636 A88-47475

Effective use of buffer gas sleeve-type seals in centrifugal compressors
p 677 A88-47566

Computation and analysis of the shapes of S1 and S2 streamsurfaces in a transonic compressor rotor
[AIAA PAPER 88-3734] p 646 A88-48985

Full 3-D iterative solution of transonic flow for a swept wing test channel
[AIAA PAPER 88-3735] p 646 A88-48986

The effect of boundary layer on transonic cascade flow
[AIAA PAPER 88-3782] p 646 A88-48995

The effect of forward skewed rotor blades on aerodynamic and aeroacoustic performance of axial-flow fan
[AIAA PAPER 88-3783] p 688 A88-48996

E

EGYPT

Computation of three dimensional transonic flow in a centrifugal impeller using Euler equations
[AIAA PAPER 88-3731] p 645 A88-48983

F

FRANCE

Airbus and ATR system architecture and specification
p 662 A88-45952

Drag reduction performance on riblet surfaces and through outer layer manipulators
p 632 A88-46236

Airbus training facility combines flight simulation with computer-based instruction
p 671 A88-46273

Introduction to hypersonic aerodynamics - Modeling problems
[AAAF PAPER NT-87-02] p 633 A88-46326

Development of calculation methods for inviscid hypersonic flows
[AAAF PAPER NT-87-03] p 633 A88-46327

Physicochemical nonequilibrium effects in hypersonic flows
[AAAF PAPER NT-87-05] p 633 A88-46329

Test methods in hypersonics
[AAAF PAPER NT-87-09] p 671 A88-46333

Flow around and downstream of pointed or blunt yawed cones in a Mach 7 or 5 stream
[AAAF PAPER NT-87-10] p 633 A88-46334

Methods for measuring convection flux in the R2 and R3 wind tunnels at Chalais-Meudon - Current implementation and future developments
[AAAF PAPER NT-87-11] p 676 A88-46335

Prediction of the aerodynamic coefficients of hypersonic vehicles using the HABP and SHABP codes - Comparison with experimental results
[AAAF PAPER NT-87-13] p 633 A88-46337

Validation of methods for the calculation of low-Reynolds-number hypersonic flow by wind tunnel tests
[AAAF PAPER NT-87-14] p 633 A88-46338

Fundamental experiments on the passive control of the transonic shock/boundary-layer interaction
[AAAF PAPER NT-87-17] p 634 A88-46341

Study of the reduction of friction and pressure fluctuations downstream of 'aviation profile'-type manipulators in tandem
[AAAF PAPER NT-87-20] p 634 A88-46344

Drag reduction in two-dimensional flow by vortex emission control using cavities
[AAAF PAPER NT-87-22] p 634 A88-46346

Drag reduction for business aircraft
[AAAF PAPER NT-87-23] p 634 A88-46347

Thrust-reverser efficiency
[AAAF PAPER NT-87-24] p 663 A88-46348

Quantitative characterization of impact damage in composite materials - A comparison of computerized vibrothermography and X-ray tomography
p 676 A88-46826

Calculation of aircraft fatigue and damage tolerance
p 657 A88-48471

Commercial aircraft structure fatigue - Analysis of expected in-service loading and the prediction of structural component behavior
p 658 A88-48472

High-temperature dimensioning of turbine disks
p 665 A88-48473

Unsteady aerodynamics of an airfoil in combined translation/pitch oscillations below and through stall
[AIAA PAPER 88-3540] p 641 A88-48873

Prediction of propfan noise by a frequency-domain scheme
p 666 A88-49015

Statistical properties of real time events in an ATC (Air Traffic Control) system
[PB88-118781] p 655 N88-26353

Flight Mechanics Panel Symposium on Rotorcraft Design for Operations: Technical evaluation report
[AGARD-AR-243] p 659 N88-26362

Sensitivity to crack initiation in thick assemblies. Test report 48-444
[REPT-48-444] p 660 N88-26365

Multivariable identification of a flexible transport aircraft
p 660 N88-26525

Parallelization on a multiprocessor system of a solution method for the unsteady Navier-Stokes equations at high Reynolds numbers
[ONERA-NT-1987-8] p 684 N88-26632

Treatment of the separated flow around profiles (nonviscous, incompressible, two dimensional flow) by the singularities method
[ISL-R-106/87] p 684 N88-26633

G

GERMANY, FEDERAL REPUBLIC OF

Software diversity in computerized control systems
p 685 A88-45951

Experiments on three-dimensional riblets
p 632 A88-46243

Modern combat aircraft design
p 656 A88-46311

The 'financial stability' of an airline - Quo vadis?
p 689 A88-46422

The integration of airplane avionics equipment in flight simulators
p 672 A88-46441

Project ROSAR - A high-resolution, all-weather visibility method for helicopters
p 654 A88-46521

The trick with light-emitting diodes - How to recognize a wing's aerodynamic quality at a glance
p 676 A88-46663

Unsteady flow in a centrifugal compressor with different types of vaned diffusers
[ASME PAPER 88-GT-22] p 681 A88-49176

A characteristic method for calculating the generalized flat flutter aerodynamic forces
[NASA-TT-20300] p 647 N88-25438

Ludwig Prandtl collected treatises on applied mechanics, hydro- and aerodynamics, part 1
[NASA-TT-20316] p 650 N88-26337

Ludwig Prandtl collected treatises on applied mechanics, hydro- and aerodynamics, part 2, IV interfaces and resistance
[NASA-TT-20315] p 651 N88-26338

Airbus 1987: Success in Europe
[ETN-88-92099] p 660 N88-26364

Flight vehicle system identification: Status and prospects
p 660 N88-26520

A two-point aerodynamic model for identification
p 660 N88-26526

The identification of the direct lift control flap system of the research aircraft ATTAS
p 661 N88-26527

Parametric estimation of aerodynamic nonlinearities in rolling moment due to sideslip using maximum likelihood method
p 661 N88-26528

Flight test preparation and measuring data validation for parameter identification
p 661 N88-26529

A new method for the estimation of aircraft inertia characteristics
p 661 N88-26530

Utilization of identification methods in the time and frequency domain for the determination of the XV-15 (tilt-rotor) dynamics for lateral motion in hover flight
p 661 N88-26532

FORMING

- Application of complementary parameter identification techniques to flight test data of a transport aircraft p 661 N88-26533
- Nonlinear identification of an aircraft for the direct calculation of an anticipatory control p 670 N88-26535

REPORT NUMBER INDEX

Typical Report Number Index Listing

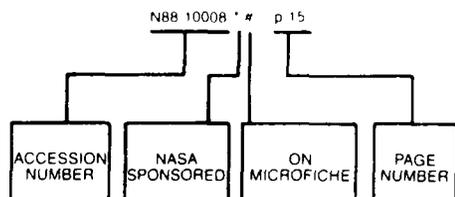

Listings in this index are arranged alpha-numerically by report number. The page number indicates the page on which the citation is located. The accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

ACCESSION NUMBER INDEX

Typical Accession Number Index Listing

Listings in this index are arranged alpha-numerically by accession number. The page number listed to the right indicates the page on which the citation is located. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

AVAILABILITY OF CITED PUBLICATIONS

IAA ENTRIES (A88-10000 Series)

Publications announced in *IAA* are available from the AIAA Technical Information Service as follows: Paper copies of accessions are available at \$10.00 per document (up to 50 pages), additional pages \$0.25 each. Microfiche⁽¹⁾ of documents announced in *IAA* are available at the rate of \$4.00 per microfiche on demand. Standing order microfiche are available at the rate of \$1.45 per microfiche for *IAA* source documents and \$1.75 per microfiche for AIAA meeting papers.

Minimum air-mail postage to foreign countries is \$2.50. All foreign orders are shipped on payment of pro-forma invoices.

All inquiries and requests should be addressed to: Technical Information Service, American Institute of Aeronautics and Astronautics, 555 West 57th Street, New York, NY 10019. Please refer to the accession number when requesting publications.

STAR ENTRIES (N88-10000 Series)

One or more sources from which a document announced in *STAR* is available to the public is ordinarily given on the last line of the citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code preceded by the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on NTIS PRICE SCHEDULES.

Documents on microfiche are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report number* shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, as indicated above, for those documents identified by a # symbol.)

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26.1 reduction).

- Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)
- Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.
- Avail: ESDU. Pricing information on specific data, computer programs, and details on ESDU topic categories can be obtained from ESDU International Ltd. Requesters in North America should use the Virginia address while all other requesters should use the London address, both of which are on the page titled ADDRESSES OF ORGANIZATIONS.
- Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).
- Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.
- Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.
- Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.
- Avail: US Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of \$1.50 each, postage free. (See discussion of NASA patents and patent applications below.)
- Avail: (US Sales Only). These foreign documents are available to users within the United States from the National Technical Information Service (NTIS). They are available to users outside the United States through the International Nuclear Information Service (INIS) representative in their country, or by applying directly to the issuing organization.
- Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.
- Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC: NASA and NASA-sponsored documents and a large number of aerospace publications are available to the public for reference purposes at the library maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN: An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England for public access. The British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy or microfiche of NASA and NASA-sponsored documents, those identified by both the symbols # and * from ESA – Information Retrieval Service European Space Agency, 8-10 rue Mario-Nikis, 75738 CEDEX 15, France.

FEDERAL DEPOSITORY LIBRARY PROGRAM

In order to provide the general public with greater access to U.S. Government publications, Congress established the Federal Depository Library Program under the Government Printing Office (GPO), with 50 regional depositories responsible for permanent retention of material, inter-library loan, and reference services. At least one copy of nearly every NASA and NASA-sponsored publication, either in printed or microfiche format, is received and retained by the 50 regional depositories. A list of the regional GPO libraries, arranged alphabetically by state, appears on the inside back cover. These libraries are *not* sales outlets. A local library can contact a Regional Depository to help locate specific reports, or direct contact may be made by an individual.

STANDING ORDER SUBSCRIPTIONS

NASA SP-7037 and its supplements are available from the National Technical Information Service (NTIS) on standing order subscription as PB 88-914100 at the price of \$8.50 domestic and \$17.00 foreign. The price of the annual index is \$14.50. Standing order subscriptions do not terminate at the end of a year, as do regular subscriptions, but continue indefinitely unless specifically terminated by the subscriber.
